'We will make it work' Wilmot tells the CSA

by Kevin Cahill
THE deal that ICL is offering software houses will work this time. That was the message Robb Wilmot gave an audience of Computer Services Association members, along with an acknowledgment that ICL had frequently got it wrong in the past.

He told the guests at the association's Annual General Meeting luncheon that ICL was now offering software and system houses unqualified inclusion in the ICL software catalogue, which would be going to 86 countries. Previously ICL had attempted to vet each product offered by a non-ICL source.

He also offered the software houses the use of ICL premises overseas, an offer which must be very attractive to the many software houses marooned in the stagnant waters of the UK economy.

But Wilmot intends to be tough with those who break the, as yet unwritten, rules which will govern who does what in the partnership with ICL.

"There will be certain rules set down for behaviour, and disciplinary measures will be drawn up for those who break them," he said.

Wilmot also indicated that ICL was willing to go much further than any other company in releasing software and operating system specifications to the software houses. The releases would include interface specifications, he said, and he indicated that over 150 had been released so far.

There would be arrangements for software suppliers to test and run their products in conjunction with ICL on ICL equipment, and software vendors would be invited to act as consultants on ICL turnkey projects, including work on the Atlas 10 and 25 range.

The offer of the use of ICL premises and the opportunity to go in with ICL to its customers' sites, appears to represent a far higher level of commitment than is shown with other vendors' offers.

Digital Equipment, DEC, a pioneer of the idea that the parent supplied the hardware and systems software and the software houses supplied the applications software, produces a software directory, but vendors have to buy DEC kit to test and develop their systems.

DEC has always advertised the concept of third party benefits and its president, Ken Olsen, said that the object of supplying equipment like DEC's was to help make a lot of people rich.

Wilmot echoed the same idea when he said: "We are all going to make it."

The reaction of the audience was mixed. Representatives inquired how old and unresolved disputes would be settled. Wilmot gave them names, winding up with his own "if you can locate me". But there was a strong feeling that while Wilmot was in charge things would, as he claimed, work.

IT city of Europe

by Robert Parry
WITH the formation of an information technology policy advisory group, Milton Keynes is gearing up to become the Information Technology city of Europe.

Many leading lights of the UK IT business make up the group, which is chaired by Sir Henry Chilver, vice-chancellor of Cranfield Institute of Technology and chairman of the NEDC's electronics development committee.

Milton Keynes' IT strategy is to make it the foremost city in Europe for the practical application of IT at work, in the home and in the community at large.

The advisory group will review this strategy, using their own experience to identify opportunities for the city to set the pace.

Among the group members are ICL's Robb Wilmot, David Fairbairn of the NCC, Sir George Jefferson of British Telecom and Thorn EMI's Tom Mayer. The Department of Industry is represented by John Thynne, assistant secretary of the IT division. Eosys, formerly Urwick Nexos, was appointed to act as consultants last November.

The main element of the project is the setting up of an Information Technology Exchange to be opened later in the year. It will act as a focal point for the business community, giving advice and information, providing training and offering services and equipment to hire or buy.

Other aspects include the provision of a communications infrastructure using the existing cable network to bring TV to 20,000 households, and a trial optical fibre cable with British Telecom.

CHILVER... chairman of Milton Keynes' info tech group.

Announcement expected on supply of system to Bank of England and Stock Exchange

Three firms bank on gilt-edge contract

by Andrew Thomas and Our Parliamentary Correspondent
THE prestigious contract to supply the Bank of England and the Stock Exchange with a computerised system for the transfer of gilt-edged securities should be awarded this week. It is almost five years since a committee was set up to study the project.

IBM, ICL and Tandem are believed to be the three manufacturers on the short-list for the order. While the £1.25 million hardware value of the contract is not enormous in the banking world, the kudos it brings will be a significant filip to any of the three companies' attempts to expand their banking presence.

An enabling Bill to authorise the setting up of the system obtained an unopposed Second Reading in the House of Lords last week. A change in the law was required to provide for the transfer of stock other than by an "instrument of writing".

The present procedure of transfer through a written instrument has caused considerable strain because of the increase in the activity in the gilt-edged market. The Bill

lists the 200 securities to be covered by the system, and also provides for drawing up regulations to deal with the storage and eventual destruction of documents relating to local authority stocks and bonds.

The Bank of England and Stock Exchange system for transfer of specified securities, called BET, will be based on two minicomputers linked to a nationwide communications network, with a service to 275 users initially. It will provide a means of moving gilt stocks from one stockholder to another without the need for transfers or certificates when the stockholders involved have accounts within the system.

Subscribers will have to pay a charge to participate.

The BET system is to be financed jointly by the Bank of England and the Stock Exchange.

The initial capital outlay is in the region of £1.25 million, and annual operating costs, including leasing charges, will run at just over £1 million.

The BET project is scheduled to take three years to go live. The first year involves the specification of the detailed system to program

specification level, the second will see the installation of the hardware and communications system, and year three will be spent testing the system. It is expected that more than 30 jobs will be created.

Sources at the Bank of England indicated that a "fair amount" of new hardware is to be installed, and that negotiations with the three firms asked to tender had reached a "commercially sensitive stage".

"You'll be hearing something very soon," said a Bank of England spokesman.

This story towards modernising both the Bank of England and the Stock Exchange was warmly welcomed by peers on both sides of the House of Lords, and Lord Terrington (Ind) said that computers already in use had proved extremely reliable and the new systems would be a further step forward.

The Stock Exchange has had a computerised settlements system for jobbers, called Talisman, for some years.

Lord Bruce wanted written into the Bill that the computer terminals would be sited in the UK. This was confirmed.

The Bank of England: £1.25m partnership with the Stock Exchange.

Civil servants take a hard line

by John Kavanagh
THE government faces the threat of industrial action over the introduction of computer systems following the rejection of a new technology agreement by the biggest civil service union, the Civil and Public Services Association, at its annual conference in Brighton last week.

And the new hard line on technology was backed up by elections which saw left-wingers taking over the executive committee.

These moves followed votes on motions censuring the existing leadership over last year's pay negotiations, which involved a five-month strike, and over the fact that the technology agreement was signed without consultation with members.

The CPSA's new general secretary, Alistair Graham, said the agreement - which runs until the next general election in two years' time - was the best that could be expected from the Conservative

government. He argued that rejecting it could only mean industrial action against new computer systems. He and supporting speakers were sure members would not strike over such an issue.

GRAHAM... "Members would not strike."

US micro firm takes control

by Boris Sedacca
CALIFORNIA based Alpha Micro Systems has acquired Alpha Micro Systems (Europe) from Alpha Micro Systems UK for \$900,000, including the UK network of 38 dealers.

At the same time Alpha Micro Systems UK has changed its name to Alpha Computer Systems and will continue to handle certain key accounts for the machine. The company was making losses up to and including last October but made a net operating profit from January to April this year of £419,000 with an exceptional item including the sale of software to the US company.

Alpha Micro systems were first launched into the UK market by Computer Marketing, subsequently renamed Comma Computers. Comma then bought Micro Software Systems in June 1979, a 12-man software house started two years previously by four ex-TOPS programmers.

The MSS staff left Comma in early 1980 to join Alpha Micro Systems UK, a company set up independently of the US manufacturer with sole distribution rights for the machine for the whole of Europe, with Leslie Button as managing director.

Marketing chiefs quit

by Howard Karten
SEVERAL top marketing managers at Datapoint in the US made sudden resignations last week. The resignations appeared to be connected with an audit currently being carried out on the company's third quarter financial results.

The Texas manufacturer declined to comment on the reasons for the resignations. However, Datapoint's auditors are currently investigating a number of unusual situations involving Datapoint's third quarter results.

The situations are believed to centre on orders that were originally recorded as sales, but which were later refused by the buyer. The revenues were apparently recorded on Datapoint's books and were later cancelled.

For the quarter ended January 21 Datapoint recorded a profit of \$11.2 million, down from the \$12.1 for the same quarter 1980-81.

Datapoint UK is not associated with its parent's problems.

Lack of DP staff in City

by Boris Sedacca
INCREASED banking activity is threatening to catch the City with a shortage of skilled computer staff.

International banking operations in the City of London, which are growing at an annual compound rate of 37%, are the main cause of the pressure.

Although London is facing strong competition from New York to become the world's leading financial centre, it has some licensed deposit-takers than at any time previously.

Even New York banks have been hit with computer staff shortages and have begun recruiting in the UK.

But London branches of overseas banks are having their own problems. A data processing manager for the London office of another leading New York bank says that analysts who really understand user requirements in banking are very thin on the ground.

"Staff which have been adequately trained number in their dozens at present rather than in their thousands as is the case with payroll programmers for example."

"Finance applications are one of the greatest growth areas for computer staff comparable to areas like database management systems. When we get new staff in, they go through a stiff training exercise and it takes about 18 months to get them to a basic level of competence - three years to make them fully familiar with our systems."

Over 35 new licensed deposit-takers were allowed into London last year, bringing their total to over 400. According to Emyln Williams, a director at International banking specialist firm Lombard Systems International,

there are 87 new applicants this year, and more will be allowed in than last year.

£1/2m loss threatens govt loan scheme

by Kevin Cahill
A POSSIBLE change of heart by the government over the loan guarantee scheme is threatening the hopes of hundreds of small company entrepreneurs in the computer industry.

The scheme has been used to give £62 million to entirely new companies, over 300 of which are in the computer sector.

So far the government has lent a grand total of £131 million, of which £500,000 has been lost.

The scheme, under which the government guarantees up to 80% of a loan made to a company by bank, and which does not require that an entrepreneur commit personal security, is threatened because of losses of over £500,000.

Following evidence to a House of Commons committee last week by John McGregor, an Industry Minister, many commentators believe that the government will announce changes to include borrowers taking up part of the guarantee burden themselves.

According to Phil Colyns, a director of Scribe Computers, which was recently set up with the aid of a government loan guarantee, this would stop many people from starting out on their own.

"The whole point of the scheme was to give an entrepreneur a real unhindered opportunity to build a company without the additional worry of putting up his home as a security as well."

NEWS BRIEF

CDC to sell micros

CONTROL DATA is the latest computer manufacturer to enter the microcomputer market. It is to sell the Altos ACS8600 16-bit micro through its business centres in the US. Altos says it expects to ship between 3,000 and 5,000 units to CDC over the next five years.

First shipments will be in December. There are no known plans to bring the machine to the UK.

Payroll changes

THE new sickness pay and benefit rules come into force on July 14 and will immediately alter over 20 million contracts of employment with far-reaching consequences for computerised payroll systems. The full extent of the changes will be clear when the Department of Health and Social Security publishes its employers' guidelines next month.

Extel buoyant

CITY-BASED information supplier Extel showed gains in both profit and turnover for 1981/82. Sales rose 14.8% to £99.19 million and profits went up 24% to £4.45 million. Extel is understood to be pursuing takeovers in the computer sector and has a microelectronic manufacturing facility under construction in the Thames Valley.

China go-ahead

A MAJOR conflict within the US administration over the strategic materials embargo which prevented delivery of a Japanese-built mainframe to China, has been resolved. Hitachi, which received an order in 1979 for its M180 to be delivered to an unspecified Ministry in Beijing, has said it will be delivered in two months.

Burroughs new president takes over in top level shake-up

by Kevan Pearson

A NEW man has taken control of the day-to-day running of Burroughs in the US. Paul Stern, previously executive vice-president, has taken over as president and chief operating officer.

He replaces DuRay Stromback, who is to retire at the end of the year. He will continue as vice-chairman until then. Burroughs denies that he is being asked to step aside.

The move is seen by Wall Street sources as completing the managerial changes which began with the appointment of Michael Blumenthal as chairman 18 months ago. Since then Blumenthal has put outsiders into 20 of the top 25 positions at Burroughs.

Stromback was appointed to the presidency at the same time as Blumenthal became chairman and chief executive.

The board has also approved changes in the managerial structure of Burroughs, which will simplify the control of the company and put Burroughs' full weight behind the "line of business" marketing policy which the company talked about eight years

ago. This divides Burroughs' marketing into specific industrial sectors rather than across the full spectrum of computer users within geographic areas.

In the UK, Burroughs' image continues to improve. There was plenty of support for its latest products at the recent UK meeting of the Association of Burroughs Computer Users, says ABCU chairman Eric Holloway.

Of particular interest was the Lines software generator package, which Burroughs claims can cut system development time by up to 90%.

Holloway said the system was "very impressive", provided the claims could be substantiated. He added that his own company, Alcan, would be having a demonstration of the system to determine its usefulness. Lines was developed by a New Zealand software house, and has been purchased by Burroughs for worldwide distribution.

Burroughs' Ofis 1 office automation system also attracted a lot of interest, and the conference decided to form an Ofis interest group to work with Burroughs in this area.

Annette Goodhart of F International's Amsterdam office answers inquiries as chairman Steve Shirley (right) looks on.

CSA goes overseas—but turnout for software seminar disappoints

POOR attendance at a seminar aimed at promoting British software expertise marred what was otherwise a successful first collective overseas exhibition venture by the Computing Services Association.

The show was Europe Software 1982 in Utrecht last week, and most British companies that took advantage of the CSA's joint exhibit were well satisfied, according to director general Dr Doug Eysencks.

The show provided cheap low-risk exposure to the Dutch market, although any exhibitor expecting the event to live up to its grandiose name and attract a pan-European audience would have been disappointed. Nearly all who attended were from the Netherlands.

About the seminar held next

door to the main exhibition hall Eysencks remarked, "The British Embassy in the Hague were responsible for finding an audience for us, and they told us a week before the show that they were expecting 100 people, including more than 50 who had given written acceptances—all senior people from the Dutch industry. But only about 20 turned up. I don't know why. I suppose the CSA should have handled the invitations itself."

Peter Davies, commercial counsellor with the British Embassy in the Hague, admitted that the turnout was disappointing. "More than 200 Dutch people were invited. We registered 38 people who turned up but that included CSA members."

"We intend to ask people who sent written acceptances why they

didn't attend, and also to send copies of the seminar papers to all those invited."

Apart from Doug Eysencks, speakers at the seminar included CSA president Roger Graham, Hoskyns Group marketing director Brindley Reynard, and chairman of F International Steve Shirley.

Any disappointment Steve Shirley may have felt about the seminar was more than compensated for by her delight with the interest in F International's exhibit.

"We have made more impact in Holland with our stand at Europe Software than we have made in the four years that we've been operating here. The sales inquiries we have picked up are like gold dust," she said.

NEWS BRIEF

GEC may buy West German giant

AFTER five years of losses, West German electrical giant AEG Telefunken looks set to break up, with GEC of the UK a potential buyer of the company's electronics subsidiary.

AEG is one of West Germany's biggest electrical manufacturing concerns with interests in a broad range of electronics and related fields. Although the data processing and electronics business is thought to be profitable, the consumer electronics divisions have persistently forced the company into losses.

More power

BRITISH minicomputer manufacturer CTL has enhanced its IBM communications support. It has launched a more powerful version of the 3270 emulator. The new product will allow any CTL system using the company's ICE network to act as a cluster controller supporting up to eight workstations.

Software release

MINICOMPUTER manufacturer Computer Automation in Rickmansworth has released a software package to link its SyFA users within an existing SNA network to a host IBM mainframe. SyNET, already installed at Rank Hovis McDougall's IBM-based centre, enables the user to collect data from SyFA node processors for storage on the host machine, or to distribute it to them, and to initiate utilities remotely.

Thousand sales

SALES of ICL's System 25 minicomputers have exceeded 1,000, less than a year after launch. The company has also affirmed System 25's place in its product line with the announcement of additional facilities, including a new processor with 50% more performance.

Intel strengthens hold on 16-bit market with five-year expansion plan

by Robert Parry

ON the heels of National Semiconductor's official release of its new high performance microprocessor family comes fighting talk from Intel.

With its iAPX 186, a more powerful and highly integrated version of the 8086 16-bit processor now available for sampling, Intel claims a ten-fold improvement in performance/price ratio and the disappearance of the cost hurdle in moving from eight to 16 bits.

Within the next five years, Intel plans to introduce over 70 new processors and support chips. In the high performance microprocessor market these will include market segment oriented versions of the iAPX 86 family—integrating tasks on to the processor chip for particular applications such as robotics, personal computing and word processing—and a 32-bit version, the 386.

By pulling support functions on to the main 186 processor chip, Intel reckons it has reduced the

cost of components for a typical 16-bit application to less than half that of an 8086-based kit, and only a little more than an 8-bit 8085 system.

In large quantities Intel estimates the 186 plus two latches will cost about \$36, compared to \$74 for an equivalent 8086 system with about 20 separate chips.

"It will allow Intel to penetrate key markets," says Microprocessor and Development Systems Division general manager Dave House, "and will have a profound business effect. It will convert a significant proportion of the 8-bit market to 16 bits."

While House still sees shipments of the 8086 increasing over the next few years, he feels customers will move over to the 186 for new designs. "I expect the 186 to become the favourite over the next couple of years."

He dismissed competition from National's new chips (see page 6)—"they are too late"—but sees two main rivals: Motorola,

offering an alternative chip architecture, and Japan as an alternative hardware source.

The 186 ties up the range of processors promised by Intel two years ago. These included the 186, 286 and 432 at the top end of the 16/32-bit scale. The 32-bit 432 has a different architecture from the others, an object-oriented architecture which House thinks will dominate by 1990.

Meanwhile, the march of devices using the 8086 architecture, targeted at data processing applications and traceable back to the first microprocessor, Intel's 4004, continues. A 32-bit device, the iAPX 386, is scheduled for 1984. It will be compatible with the earlier chips. Like the 286 it will have an emulation mode enabling it to run 8086 software "blindingly fast," says House.

The 386 will have a 32-bit bus, Multibus II, and be able to address large data structures using 16-megabyte segments.

HOUSE... Opening up the 16-bit market.

Graduate list set up by NCC

by Andrew Thomas

THE National Computing Centre has set up a register of graduates seeking employment in the computer industry in an attempt to reduce the shortage of experienced staff. A survey carried out by the NCC and Computer Weekly in December showed that there were 11,000 fewer applicants than vacancies at all levels.

Alan Lewis, a senior consultant for the Careers Projects Division of the NCC, claims that the problem stems from a failure by employers to recognise that new talent must be brought into the industry. If investment in training is not made, the supply of experienced staff will dry up, he said.

The register, at present restricted to the North-west, contains details of graduates who have expressed an interest in working with computers and who have successfully completed a four-hour test for suitability as programmers or analysts.

Prospective employers are offered a selection service, and are furnished with a short-list of the five graduates deemed most suitable for their needs.

Govt accused of 'fudge and compromise' on data protection law

by Our Parliamentary Correspondent

THE government has refused to give any firm undertakings to include data protection legislation in the next parliamentary session. But Home Office Minister Timothy Raison again confirmed that the government was committed to making progress on the issue.

Raison was replying to criticism in the Commons of the government's White Paper on data protection. Andrew Bennett (Lab, Stockport North) called the White Paper an example of "fudge and compromise" satisfying nobody.

Bennett said during Commons questions that the White Paper would not give genuine protection to the individual and was in danger of setting up a bureaucracy which would achieve nothing.

Raison acknowledged that the comments so far received included

criticisms of features of the proposals. But he reported that there had been widespread acceptance that the government's approach was a reasonable and balanced one.

Bennett's "tired platitudes" did not help, the Minister said. The government believed that legislation would prove right and would be widely accepted.

Geoffrey Dickens (Con, Huddersfield) asked for a review within 12 months if the data protection procedures outlined in the White Paper proved ineffective.

Robert Croy (Lab, Kelghley) protested at the lack of any provision in the White Paper for the protection of the accumulation of data in the £20 million special branch computer. But Raison said it had been made clear in the European convention on the subject that matters involving State Security were exempt from legislation.

BGS drops Logica as UK agent

by Andrew Thomas

BGS SYSTEMS, which specialises in capacity planning products, has dropped Logica as its UK agent.

The US company is to launch a direct marketing campaign for its packages in the UK. Its products, such as Best1, Crystal and Capri, are MVS, have been supplied to more than 300 large installations, mostly in the US.

Nick Kenyon, manager of Logica's capacity planning division, expressed surprise at the BGS decision to go it alone.

"As far as I'm concerned, we're still negotiating deals with BGS for their products. Beyond that I'm not prepared to comment," he said.

Robert Goldberg, BGS vice-president and co-founder, was in London last week for the start of the UK campaign. He confirmed that his company was cutting out Logica. "I believe we can give a better service to our customers by dealing with them direct," he said.

"There is a real need for accurate capacity planning and predictive tools in the UK, especially in the banking field. I believe that the UK is several years ahead of the

'Scrap Prestel index'—Consumer Council

by Andrew Thomas

MATERIAL held on Prestel is not subject to stringent enough testing before being introduced, and the indexing system is frustrating for users, according to a report published by the National Consumer Council.

The report, prepared by E. Scott Maynes, professor of consumer economics at Cornell University in the US, says that British Telecom should introduce lower charges for private users in order to establish a domestic market.

Maynes cites several shortcomings of Prestel, including the lack of testing before material is introduced to the system, and advises that the hierarchical indexing system, designed for ease of use, should be scrapped. Some subject headings are ambiguous, and there is nothing to warn users if the information they require is not available, he says.

Fifteen questions were devised to test the system. Answers to these questions were either highly satisfactory or highly unsatisfactory.

The main recommendations of the report include the replacement of the existing tree index with something which will minimise the possibility of wild goose chases, save money, time and psychological effort when searching for information, and maximise the probability that the consumer will obtain the data required.

Maynes envisages a system which will operate using several keywords which together might solve the consumer's problem with a single inquiry.

A possible alternative would be the revision and expansion of the printed, classified index, rather than reliance on the internal index. *Prestel in Use, National Consumer Council, 15 Queen Anne's Gate, London SW1 22Q.

MAYBE ALL YOUR CPU NEEDS IS A SHOT IN THE ARM.

If your CPU is overloaded with transferring data to disk we can offer you a 'miracle' cure.

The STC 4305 dramatically reduces data transfer times thus rejuvenating the processor to perform the task it was installed for—data manipulation.

The 4305 achieves this because it is our fastest I/O device currently available, with an access time of 0.3 milliseconds.

This offers the considerable advantages of releasing large capacity disks for more productive use, memory conservation—reducing working set size, and improved throughput.

The 4305 is one of STC's

complete range of tomorrow's products available today.

Our Systems Engineering department is equipped to advise you on the best use of this device.

STC knows everything there is to know about high density rapid access storage. That's why we are the fastest growing PGM peripheral suppliers in the UK+Europe.

For more facts and information on tomorrow's products, today, call Roy Dodds, UK Sales Manager on Esher (0372) 67041.

HP optimistic as its growth curve mounts

by Kevan Pearson

WITH most of the growth in the computer industry over the next few years in small systems and the IBM market, including plug compatible manufacturers, the other major mainframe manufacturers could be in "deep trouble".

But Hewlett-Packard's position in the market - with systems costing under \$300,000 - should leave it well placed to meet its widely stated ambition of becoming the third largest computer manufacturer behind IBM and Digital Equipment by 1985, according to Paul Ely, corporate head of HP's computer division.

HP is where the growth is, says Ely, who predicts that by 1985 "sales of computer systems costing between \$20,000 and \$300,000 will constitute half the total of all computer business and will equal sales in the mainframe market."

HP's 34% growth in 1981 put it in seventh place in terms of dollar revenues, behind most of the established mainframe makers. What distinguishes HP from the others (except DEC) is the fact that its growth rate is more than twice the industry average of 14%. Its growth is also more than twice

that of its rivals in the race - the established mainframe manufacturers Sperry Univac, NCR and Burroughs.

On the face of it, HP's top-line computer, the HP 3000, has been around for a long time, and even the top model does not allow 32-bit addressing, unlike DEC's VAX range and Data General's MV 8000.

This could be viewed as a serious drawback in HP's ambitious plans, but Ely does not think so. "Not many business applications require 32-bit addressing. It is important, but it's not the whole issue - overall performance is more important."

The HP 3000 series 64 is rated at over one million instructions per second, putting it well into the middle of IBM's 4300 range. "It offers twice the performance of the HP series 44 version, which itself was rated as twice as powerful as the series 40 machine. So in two years we have offered a ratio of improvement of four to one," says Ely.

Moreover, the 64 is a 32-bit machine in everything other than memory addressing, and Ely says it even has this capability. The problem is that the company's

MPE operating system cannot handle 32-bit addressing, so to maintain upward compatibility HP had to omit it from the specification.

The company is committed to the high performance end of its market and plans to launch a fully fledged 32-bit general purpose computer within the next few years. "The problem," says Ely, "is now to change the operating system without the user knowing it."

HP is widely regarded as having taken the lead in the 32-bit chip set stakes when it announced its product at the International Solid State Circuits Conference in February this year.

The previous leading product was Intel's iAPX 432, but HP expects to have its product available for production machines by the end of the year. Its first appearance will not be in the 3000 series, however, but in the company's technical and scientific product range where the need for 32-bit addressing is more important.

There are already several products in this market like Apollo Computer's Domain and the Three Rivers Perg. "We are not, going to compete head-on with

ELY... "Third largest by 1985."

them," explained Ely, "but they illustrate the point."

Of the Japanese threat, Ely thinks it will be beneficial to the industry in the long run. "The Japanese have opened a lot of eyes as to what is possible both in pro-

ductivity and quality. They have changed expectations of what we can do."

Nor does he think that they can take on IBM in a big way, and he cites IBM's flat profitability over recent years as the reason why.

SALES BRIEF

Bank spends £9 million on information

THE Royal Bank of Scotland has placed £9.3 million of orders for the third phase of its programme of equipping branches for growth. Having started with cash machines in 1977 and teller terminals in 1979, the bank is preparing to install (from next spring) £6.25 million of IBM minis and screen £1.4 million of Case communications equipment and £1.65 million of Philips printers.

They are to be used in a customer information system designed, for example, to speed up personal loan negotiations or a print statements on demand.

Ferranti switch

FERRANTI has won a £3 million contract for the Foreign and Commonwealth Office for a message switching system based on the Ferranti Argus 700-GC mini. Whitehall and Buckingham Palace. The system is to be fully operational in 1984, replacing a large manual system in handling messages over radio links, leased lines and the telex network worldwide.

Gulf system

HAWKER Siddeley Dynamics Engineering has won a £500,000 contract for a distributed data collection system to be used in the Bani Yas power station being commissioned in Abu Dhabi by John Brown Engineering. The system uses HDSE Sequel microprocessors and software developed by the Central Electricity Generating Board using HDSE algorithms.

Amdahl pips IBM

BRADFORD based Empir Stores has installed an eight-Mbyte Amdahl 470V/7C mainframe to replace an IBM 370/158. The system has 12 channels and it includes Amdahl's accelerator feature which allows extra power to be called out and paid for as needed. The machine will run CMS teleprocessing software under VM and production work under DOS/VSE in native mode.

B&B for WP

THE Bradford and Bingley Building Society is to install a Wang OLS 140 model III to handle word processing, and is the society's first step towards an electronic office. The initial deal is worth £110,000, and later this year the system will be upgraded with the addition of an Alliance 250 system providing database facilities for office staff.

ICL buys in US

ICL has gone to Californian firm Xebec for supplies of disc controllers for its personal computer system. In a deal worth \$6 million, Xebec will start delivery of the \$1410 5.25-inch Winchester controllers in July.

Data analysis

HUNTING Engineering has installed a £38,000 data acquisition and analysis system from Micro Consultants of Kenley in Surrey. The system, based on a Digital Equipment PDP-11/23 mini with Micro Consultants VHS 100 subsystem, handles 40,000 16-bit samples per second collected from acceleration, distance, pressure and temperature measurement devices.

£40,000 order

PHILIPS has won a £40,000 order for a P4500 business information system from building contractor Longbar Construction for its Newcastle head office. Longbar bought a Philips P410 five years ago for payroll and other accounting work.

FERGUSON... A network designed for growth without over-capacity.

Blue Circle get digital network plan going

by Donald Kennett

CONSTRUCTION of one of the biggest private digital networks in the UK is to get under way later this year when Blue Circle Industries installs the first of £3 million worth of exchange equipment.

The network will link 70 sites from Inverness to Exeter through seven communications nodes and, in a later phase, will support direct links from terminals and computers, run by the 80 largest of its 4,000 customers. It will use analogue links initially, handling speech and data separately, and will convert to digital links when they become economically justifiable rather than as soon as they are available.

Decisions are to be made this summer on the £2-3 million worth of minicomputers that will support distributed applications such as order collection and stock control via up to 14 of the bigger sites.

Ultimately the aim is to integrate all kinds of traffic including speech, data, facsimile, telex and telefax on to the one digital network. But even handling them

separately, the new network is expected to save £750,000 a year from 1984 on a telecommunications bill of £2 million a year.

Switching equipment includes GEC Reliance SL-1 and Herald PABXs and Case telex message switches. Transmission links include 60-channel circuits between the three main nodes in the network, which provide alternative routing facilities to cope with line failures. The remaining sites are linked by 12-channel circuits divided equally between speech and data.

Contenders for the distributed mini requirement are the IBM 8100, ICL ME29 and Honeywell DPS-6. Trials run with 8100s found them "extremely good in a number of applications," according to management services chief Doug Ferguson. "But the ME29 and DPS-6 were also very acceptable," he says.

The most likely candidates to handle the data switching are IBM's 3705 communications controller and the 3805 and 3809 plug-compatible equivalents from

FTC. The network architecture will be IBM's SNA, Ferguson says, but the company wants to avoid being restricted to IBM equipment.

Equipment evaluation team leader Simon Furey adds: "FTC gives you X25 and HDLC as well as SNA. It doesn't force you to go any particular route."

The company is concerned to standardise as far as possible without restricting its future options. It is also concerned to buy packages that will need the minimum amount of additional effort to make them do the required job. For that reason it has rejected the smaller data switches on the market, such as the Gandalf PACX.

For the same reason the company has rejected the idea of trying to implement an open network scheme, although that is the ultimate aim. "Ideally we would have an X25 network, but who has the architecture to do it?" he says. "We don't want to do any pioneering. We want packages, and until open network packages are on offer we will use SNA and 3270 emulation."

New name in UK mini market

by Kevan Pearson

A NEW name in minicomputers has entered the UK with TKT Computer Services becoming the sole UK distributor for Point 4 minis and systems.

The Point 4 range, manufactured in the US, comprises three minicomputers which strongly resemble Data General's 16-bit Nova and Eclipse machines. The design was originally based on Data General's Nova architecture, but as they have moved apart, they have moved apart. It is still possible to run Point 4's Iris operating system on Data General's Nova computers and conversion tools are available to run Data General software on Point 4 computers though they are not directly compatible.

TKT will not market the machines to end users, but will supply them on an OEM basis to the dealership network it is currently establishing. No end user price is available for the top line Mark 8 machine, but a typical end user price on the middle range Mark 5 would be about £28,000 for a fully configured system including 128 Kbytes of memory, eight terminals, and Iris.

Appicon's Series 4000 range is built around three graphics processors.

650 car dealers on viewdata

by Donald Kennett

TALBOT Motor Company is going ahead with a viewdata system which will eventually be accessed from 650 Talbot and Peugeot dealers in the UK. The decision was made following a limited trial in which 30 dealers have used the system, called Vital, since last October.

The trial ran on a Rediffusion R1800/30 mini acting as an eight-port viewdata front-end processor attached to an Amdahl V6 mainframe. The mainframe runs the Adabas database management system and the Natural query language, also supplied by Adabas Systems. The links between the two machines use IBM 3780 terminal emulation, rather than the currently fashionable viewdata gateway concept, to provide online links into the database from the dealer's terminals.

The full system will need more ports than the R1800/30 can provide, and Talbot is currently choosing between a larger Rediffusion machine and Modcomp and Aregon systems.

Talbot's systems manager Neil Campbell said the system would require 32 ports by the summer and 64 ports within 18 months. Telephone charges will be minimised by installing four-port Codex concentrators in Bristol, Edinburgh and Manchester and an eight-port statistical multiplexer in London.

The company has also negotiated a bulk-order rental agreement with Violenhire for the Philips 14-inch colour terminals that dealers will use. The total cost of the system is some £200,000, including telecommunications links and software.

Like a similar system installed by BL Cars, Vital will be used to locate new and used vehicles which meet a customer's choice of colours and features, as well as finding out the current status of orders already placed. But unlike BL's system, this information is accessed online, directly from the main database.

In BL's Stock Locator system the data is transferred from the main database every three days, using Langton's Preview software to convert it into page format for storage on the viewdata system.

IBM machine speeds up firm's reactions

by Boris Sedacca

IMPROVED programmer productivity on IBM's new architecture System 38 has enabled at least one user to develop applications and to react more quickly to his marketplace.

The company, Record Merchandiser, of Hayes, Middlesex, has the biggest System 38 installation in the UK, a Model 5. Steve Nobbs, the company's financial director, said that his old System 3 Model 15 could not keep up with sales volume.

Record Merchandiser has an annual turnover of £45 million, selling audio cassettes, records and video tape to large chain stores like Woolworth's and to specialised video retail outlets on a sale or return basis.

The company's products have a short shelf-life and low unit values, putting a premium on optimum stock control.

"When we first installed the system older staff members would not go anywhere near the screens - they even avoided the DP department. But now more people are using the screens, and this has resulted in a multiplier effect which has earned a lot of money for IBM but not an awful lot for Record Merchandiser," he said.

Nobbs said that conversion aids on batch applications from System 3 went very smoothly, with 229 batch programs and 111 sorts taking 16 man-weeks to convert. But conversion to interactive applications was not so successful.

"We had to convert 139 programs and this took much longer - about 34 man-weeks. It is not a good idea to develop System 3 batch applications to System 38 interactive working."

"We also had problems with our two IBM 3370 disc drives, both of which went over."

Subsystem lets users of LSI-11 upgrade

by Robert Farzy

DEC LSI-11 users gained an upgrade path last month when Surrey-based Arrow Computer Systems launched the Buccaneer memory subsystem into the UK.

Built by Monolithic Systems of Colorado, the Buccaneer allows LSI-11 users to expand beyond 256K of memory without abandoning their 18-bit Q-bus peripherals.

With the Buccaneer, the processor can address four megabytes of memory. Both 18-bit and 22-bit buses are built into the backplane and communicate through a peripheral bus map board. This allows existing 18-bit DMA controllers and special purpose Q-bus interfaces to be used with the expanded memory. Compatibility with RSX-11M and RSTS/e operating systems is maintained.

"Each existing 11/23 user is a potential customer," claims Arrow's managing director Brian Ash. Prices start from about £4,000 for the basic chassis with the peripheral bus map board and back-plane. An LSI-11 processor card and up to two megabytes of memory can be plugged into the chassis, along with the 18-bit and 22-bit bus controllers.

"Each existing 11/23 user is a potential customer," claims Arrow's managing director Brian Ash. Prices start from about £4,000 for the basic chassis with the peripheral bus map board and back-plane. Doctors give go-ahead to Microwriter for disabled

by Boris Sedacca

THE British Medical Association has given its stamp of approval to Microwriter, a hand-held word processor for use by disabled people.

The Microwriter, which costs £495, has been extended and developed to help disabled people whose handicaps prevent them from communicating or writing without hindrance.

The machine has been on the market for several years in what is euphemistically described as "pilot marketing," says Microwriter managing director Mike Davies. But it has now been formally launched with a view to producing 7,500 units in the initial run.

Text is input by means of a keyboard containing six keys. Characters are keyed in by depressing the right hand. The thumb is used to switch between all-phonetic and control modes.

The equivalent of five A4 pages of typed copy may be stored in the Microwriter's 8 Kbytes of memory, and this may be dumped on to cassette tape. Text may be

DAVIES... Charitable offshoot.

reviewed and edited by connection to a video monitor or domestic television set.

Now the Microwriter company has set up a charitable offshoot, called the Foundation for Communication for the Disabled, which will provide adapted Microwriters at £100 below the commercial price and adaptations including voice-synthesis at non-commercial prices.

the proven Relational Database System

Running on over 20 different ranges of mainframes and minicomputers. MicroRAPPORT-2 is now available for micro computers.

Over 100 installations in Industry, Commerce, Government and Research.

Relational Databases are easy to understand and simple to use. They reduce costs for Database users and administrators. They are simple to restructure to meet new requirements.

RAPPORT provides all the necessary facilities for fast, efficient retrieval and updating of data.

Simple commands for use in COBOL, FORTRAN and CORAL.

Other facilities include Database recovery and update logging - concurrent update protection for multiple updates - an interactive query and updating language - utilities for Database restructuring.

To find out more, or to attend a RAPPORT Seminar, please contact:

APR 11 1982

More US firms release CAD systems in UK

by Philip Hunter

TWO more US companies have entered the market with cheap computer aided design systems. Appicon, which offers users a single system for £68,000, and Gerber Systems Technology with a basic system for under £50,000, released products in the UK at the end of last month.

Both systems are capable of expansion into networks more powerful than the companies previously had available.

Appicon has built its new range, the Series 4000, around three graphics processors and two workstations based on DEC equipment and operating systems.

Gerber's new system, Autograph, was built by taking the CPU out of Gerber's IDS-80 and CAD system and breaking existing software into more pragmatic applications modules.

The Autograph processors can be built into a network by linking them together, to remote mainframes, or to Autograph's IDS-80.

"The new systems are all the same so we can mass build them, whereas in the past they were built to order," says Gerber UK general manager Chris Bailey. "That will

allow Gerber to undercut many of its competitors, he adds.

Bailey thinks the CAD/CAM market will veer away from the larger, less flexible systems which grow by adding terminals to one central processor, such as GST's own IDS-80. With the dependency on one processor, they are more prone to system crashes, he says.

"I see the time when a four-terminal system will be four Autographs linked together," he adds.

Appicon's Series 4000 is window-dressed with new software aimed at extending the users' ability to establish their own networks and databases. There is also a new graphics language which provides more programming facilities.

Appicon generated from the Apollo moon project in the US, which left a lot of unexploited technology in the public domain for all comers to exploit. It became one of the CAD/CAM leaders, and was eventually taken over by Schlumberger. Clients include Intel, which has 20 Appicon systems used in chip design.

"You can't design a chip without a CAD system," says Appicon marketing manager Mike Williamson.

MICRO NEWS

BLANDFORD... "Commercial leverage"

MPSL for Sharp

MICROSOFTWARE house MPSL has added the Sharp PC-3201 business micro to the range of hardware running its BOS/5 MicroCobol software. Over 40 8-bit and 16-bit minis and microcomputers can now run MPSL application software.

For Sharp the deal moves it well into the software business with proven business application and vertical industry packages.

The deal is with Sharp itself, but MPSL has access to some 30 dealers. "It's always nice to do business quite high up the distribution chain," says MPSL sales director David Blandford. "It gives us more commercial leverage."

NatSemi joins advanced microprocessor race

A LATE entrant has joined the advanced microprocessor race. After years of development - and delayed launchings - National Semiconductor's NS16000 is on general release, with distribution promised for July.

The family of processors is based on a 32-bit internal architecture and will include devices with eight, 16 and 32-bit external data buses. The first to appear will be the 16032, an 8-bit external chip, and the 16008, an 8-bit external chip. NatSemi has silicon for these now, says product manager Cal Rada, and samples have been with major US and European customers since last November.

The next microprocessor to appear will be the 16016, a bi-lingual version of the 16032 which also executes 8080 object code. It will be followed by the 32-bit device and CMOS versions. The new family eventually will have seven CPUs backed up by a variety of peripheral chips.

The first peripheral device will be the 16082 memory management unit to handle the virtual memory capability, which will be implemented from the start.

Major customers will have it by May, and a floating point unit (16081) and interrupt controller (16201) by September. Off-the-shelf delivery is expected by the third or fourth quarter, says Rada.

Future peripheral chips will be developed by NS16000 second sources as well as by NatSemi. There are three so far - Fairchild, Synetec and Eurotechnique - and the three will produce all of the chip family. Like Motorola's recently reinforced links with alternate sources for its 68000 microprocessor family, NatSemi's ties with its second sources are more of a partnership, a "true technology transfer" according to Rada.

More important than the hardware - and certainly more relevant than the actual width of the external data bus - is the software support for the family, Rada says. All the CPUs will be fully software compatible and a number of third party software deals have been made. Companies involved include Digital Research, which developed the CP/M micro operating system, and Whitesmiths, developers of Unix-like operating system Idris.

The software deals bring in a variety of tools for system builders to develop applications on the 16000, with two or three operating systems and some ten compilers, says Rada. The family is supported on NatSemi's microprocessor development system, Starplex, and in-circuit emulation is available.

In joining this particular chip race, NatSemi sees itself up against Motorola's 68000. "I don't think Intel will be the main competition," says Rada, despite the 8086's good lead in volume terms. "The real battle will be between NatSemi and Motorola."

It is a battle worth fighting. NatSemi estimates a world market worth \$750 million by 1985 for 16/32-bit chips and associated software, and is confident its 16000 series will take about 21% of this.

by Robert Parry

ASHBURNER... Aiming at the small to medium-sized company.

Two companies React to the mini market

A COMPUTER systems house and a consulting group have joined forces to take on minicomputer systems with a multi-user microcomputer-based estimating and control system.

The system, called React, is made up of software from Solihull-based P-E Consulting Group and hardware from CPS Data Systems of Birmingham.

CPS introduced its US manufactured hardware into the UK at the end of last year. A four-terminal system with 10 megabytes of hard disc and graphics printer to run the React software under the Oasis operating system costs just under £20,000. The package includes two weeks' consultancy to fit the system to the user's needs.

The React package enables users to assemble quotation summary listings, get component routing information, estimate for material and labour costs, and generate progress and cost reports.

"It is designed for use by the small to medium sized company," says CPS commercial manager Nick Ashburner. "and we are offering a more sophisticated package in terms of hardware and proven software than many of the mini-based products currently on offer."

Laser aimed at low end of range

SURREY-BASED mini system supplier Semaphore Computer Systems, of Godalming, has followed the trend of the big mini makers by releasing a microcomputer to attack the bottom end of its market.

Semaphore is importing US-built boards and assembling them to sell on as the Laser, a microcomputer designed for operation as a standalone unit or as part of a multi-user network. Laser uses either a Z80 8-bit processor or an 8086 16-bit chip, and comes with up to 256K of RAM. Winchester hard discs or Phoenix cartridge drives provide mass storage. The system is upgradeable from the 8-bit version to the 16-bit.

There is a range of UK application software to run under CP/M, MP/M or Oasis operating systems. Semaphore's managing director, Brian Young, favours Oasis, and sees it giving "solid multi-user handling capabilities" for the type of market he is aiming at.

"We are going for the lower end mini level application market," he says. "We already have a 16-bit mini - the Vanguard 7500 based on the Sperry range - which are fairly hefty units."

The Laser machines can cope with eight users on the Z80-based unit, or 32 users with the 8086.

Dealer appointed

KINGSTON-BASED microcomputer supplier, Computron, has been appointed a dealer for the ACT Sirius I. It will offer a consultancy service as well as providing operator training and service facilities for the machine.

32-BIT SUPERMINIS?

7 HARD FACTS FROM PERKIN-ELMER

FACT 1 Moving up to a 32-bit microcomputer dramatically increases your computing capability - adding 18 times to the 16!

FACT 2 Perkin-Elmer introduced the world's first 32-bit supermini in 1973 and now have over 100 years' continuous 32-bit hardware and software development experience more than any other manufacturer.

FACT 3 There are over 4500 Perkin-Elmer 32-bit superminis in operation worldwide.

FACT 4 Perkin-Elmer's unique range of programming productivity aids provides a basis for major economies in your software development and maintenance. This includes the fastest FORTRAN with the world's fastest universal optimising compiler, RELIANCE, the ideal TP system, UNIV, and much more.

FACT 5 Perkin-Elmer's superior operating systems help you harness the full potential of 32-bit performance easily and reliably.

FACT 6 Perkin-Elmer offers you an exceptional range of 32-bit superminis from the new 3210A entry-level processor, which costs less than some 16-bit machines, right up to the new 16MB 3250 - there's a model for your application.

FACT 7 Perkin-Elmer superminis have been perfected and proven in environments where reliability is a premium - commercial, military, geographical and aerospace applications.

For more facts on the Perkin-Elmer range of 32-bit superminis and high productivity software, call Jacqui Lake on Slough (0753) 34511.

COMPEC NORTH '82

Belle Vue, Manchester
June 22-24, 1982
Tuesday: 10.00-18.00
Wednesday: 10.00-18.00
Thursday: 10.00-16.30

The most comprehensive computer exhibition in the north is on again soon in Manchester.

MAKE A NOTE TO VISIT
Admission is by business registration and costs £2 at the door, OR **SAVE TIME AND MONEY** by sending now for FREE advance tickets.

For computer users, suppliers, systems and software houses, consultants - anyone who is professionally involved with computers - this is the ideal opportunity to see and compare the whole range of equipment and services.

A day at Compec North is the most effective way of bringing yourself up to date in today's computer market.

COMPEC NORTH is a Computer Weekly exhibition. Organised by IPC Exhibitions Ltd.

COMPEC NORTH '82

Please send.....FREE advance registration tickets.

Singapore bids to rival Japan as computer Mecca of East

A government-led computerisation effort is now in full swing in Singapore (writes a Special Correspondent). The national drive to computerise covers all areas of economic activity, including the launch of a multi-million dollar computerisation programme in the Civil Service. The success of this so-called second industrialisation aims to put Singapore on the same level as Japan by 1990, and represents major opportunities for foreign computer companies.

THE highly successful industrialisation of Singapore in the last two decades is largely due to the effectiveness of the Economic Development Board, established to attract foreign investment. Now an equally omnipotent National Computer Board (NCB) has been set up to promote and assist in the establishment, development and expansion of the computer services industry.

As its first major task, the NCB has been entrusted with a £25 million Civil Service computerisation programme over the next three years. The latter touches anything from formulating economic policies to the licensing of pets in the city-state.

Its activities encompass the 10 major government ministries: Finance (income tax processing), Trade and Industry (economic modelling), Labour (manpower forecasting), Health (online access to patients' files), Home Affairs (24-hour computer-aided response to police and emergency services), National Development (land use analysis), Communication, Environment, Education and Social Affairs.

A major objective is to provide a more productive and cost-effective service by cutting down on manpower. In contrast to most Western bureaucracy, the Civil Service in Singapore has been able to shed staff while expanding on services over the past three years.

Another major consideration is to provide a base and an impetus for the expansion of the local computer industry and form an integral part of the overall national strategy to develop Singapore into Far East's foremost computer centre.

The estimated hardware requirement includes 13 mainframe and seven minicomputers, with 683 visual display units and 208 character printers. The majority of the application areas are online, interactive systems using decentralised hardware.

The NCB will act as the sole buyer and seek out bulk purchase to reap the benefits of economies of scale. Presently the local software industry is characterised by many small firms, and the sheer size of the contract will compel them to pool their limited resources to qualify for tender.

However, the bulk of the order will still be handled by the major foreign computer manufacturers. This injection of foreign expertise will help Singapore to leapfrog to the high end of information system technology.

Apple Computer has chosen Singapore to set up its first overseas manufacturing subsidiary. Reflecting the parent company's confidence in the local availability of components, skilled labour and good operating environment, it plans to increase its initial investment of £5 million to £12.5 million.

lion. Presently it is producing 75% of the worldwide requirement of the printed circuit board (PCB) for the £700 Apple II computer.

Hard on its heels, Japan's second largest and fastest growing microcomputer company, Sord, has opened its second overseas plant in Singapore. Out of its initial investment of £4 million, 30% is earmarked for R&D facilities, and represents the first substantial R&D project to be undertaken by a Japanese company in Singapore.

The main carrot for Sord has been the generous 10-year tax-free holidays offered. For a start, the lowest class of business microcomputers, the £1,500 M23-III with a memory of 128K will be produced. Later other models sold under the brandname of Orange will be introduced.

Since its formation in 1970, Sord has achieved an annual growth rate exceeding 100% in sales and last year the figure was £25 million, 80% of which was made in recession-hit Europe.

The government has not been slow in laying a finger in the pie. A recent £2.5 million joint venture called Tata-Elxsi, between Elxsi (20%), Tata (55%) and the Singapore government (25%) will soon be producing one of the world's fastest multiprocessor computers in Singapore. Elxsi California (set up by ex-IBM engineers) will provide the hardware technology, while Tata Group (India's largest

computer user) will supply technical and managerial personnel to run the manufacturing plant.

The new £500,000 computer can utilise up to eight central processing units working simultaneously with a speed of 20 million instructions per second and a main memory of 192 Mbytes. This is six times faster than the largest IBM mainframe computer and with a larger capacity.

With at least two CPUs working simultaneously — should one stop operating, another takes over — this feature makes it especially suitable for organisations requiring computers to operate round the

'Singapore will be the only place in Asia outside Japan to have the capability to produce silicon wafers.'

clock. All features considered, the performance ratio of the multiple CPU Tata-Elxsi computer is expected to be superior to any in the world. Prototypes are currently being tested in California.

The heavy investment and high technology required in computer manufacture mean that few local companies are able to venture into it. However, Orona Singapore, a £750,000 investment of the local Dove-Chem Group, has become

the first fully Singaporean-owned company to manufacture a portable microcomputer called Attache. But initially it will assemble only key modules such as the main PCB, power supply, keyboard and cathode ray display. The computer sells for \$4,500 in the US.

Two other computer manufacturers with a base in Singapore are Digital Equipment and Far East Computers, a subsidiary of India's Hindustan Computers. The latter assembles a £7,500 word processor called Abacus Secretary.

Other manufacturers of peripheral equipment include Data Recording Heads Co (UK), and Acron (US).

In anticipation of the computer boom, several multinational subsidiaries in the electronics industry have chosen Singapore as a site to assemble and test large scale integrated circuits including 64K dynamic RAMs.

Siemens of West Germany has started production pegged at 20,000 for its own consumption while National Semiconductor plans to manufacture about 200,000 units a month for the world market.

The prize of the lot is the £15 million wafer fabrication plant to be built by the Italian electronics giant SGS-Ates. When it comes on stream in 1983, Singapore would be the only place in Asia (outside Japan) to have the capability to produce silicon wafers.

A common aspect of computerisation of industry on the island is the computerised stock control systems which have been introduced in many firms. A new and more sophisticated area is Computer-Aided Design and Manufacture. Philips Singapore has installed a CAD system from the US Computer Vision Corp at its audio factory and plans to bring more original design work from Europe. The latter also plans to start a time sharing CAD system for small companies on a basis in South-east Asia to be based in Singapore. The system suitable for mechanical drafting PCB layout and IC design, structural design and plant layout.

Many experts believe that Singapore's intense and well organised attempt to computerise will be her to achieve her industrial financial government. With a stable and efficient government as business sector, lower cost worldwide communication and extended and varied international banking system Singapore could outdo Hong Kong as the "Zoo of the Far East" — and may Asian financial centre dealing in dollar market, loan syndication and management.

Upgraded and computerised manufacturing and service sector will see Singapore confident through the 1980s with an average comfortable 10% real annual growth rate.

SOFTWARE BRIEF

UCL sets up software division

SYSTEMS house Universal Computers Limited (UCL) has formed a software division to market its library of application packages for the Pick operating system, running on UCL's Ultimate range of minicomputers.

The software division is to co-ordinate the marketing of packages developed by specialist software houses and provide support for Pick and its utilities, such as the Recall report generator.

Sales profile

MARKETING services division of Dun & Bradstreet has launched Dun's Executive File, a confidential marketing statistics programme service for clients. By matching clients' information on their customers to the D&B database of industrial information on 200,000 active UK companies, a profile of potential and actual purchasers can be built up for use in devising sales strategies.

Digital deal

UNDER a co-operative marketing agreement, Digital Equipment Corp (DEC) is to distribute Micro Focus system software products through its OEMs and direct sales force. Among products to be offered for the Professional 325 and 500 16-bit microcomputers are MicroFocus' Level II Cobol, and interactive programming tools Animator, Slideshow and Forms-2.

SOFTWARE FILE

TRUEMAN... "Salesmen have to be higher calibre."

Cost reporting

AIMING at engineering managers and cost accountants involved in government contracts, ADP Network Services has launched a cost reporting system for project managers. Called Costtrak, it produces a wide range of reports including work breakdown structures, showing the project's schedule and cost variances, manpower loading, and a summary of cost/schedule status.

Fast access

CROYDON-based software house Spider Software has launched a database management package for the Apple II microcomputer which, it claims, offers a retrieval time of three seconds on a primary index search. Called Access, the system requires an Apple II system with 48K of memory and two disc drives, and costs £199.95 including VAT.

'Grown-up' market calls for sharper, higher calibre salesmanship

COMPUTER WEEKLY, June 3, 1982

by Maggie McLening

THE software market has grown up, and sales techniques must become more subtle and sophisticated to penetrate it. This was the message from Ken Trueman, director of RTZ Computer Services of Bristol, at a presentation to members of the Computing Services Association at a seminar last week on profitable software selling.

"Products have to be better because the market is now more sophisticated, and salesmen have to be higher calibre, as well as sharper and more professional," he said. While Trueman's comments were addressed to those who sell software, purchasers of software would do well to be aware of the techniques used upon them.

Outlining each step of the sales cycle, he emphasised that selling a product such as high value financial software, which has a sale lead time of up to six months, the salesman must constantly evaluate the likelihood of his success, to avoid wasting time and money.

Correct identification of the parties involved on the purchaser's side, particularly of the ultimate decision-maker he considered essential for application of pressure to close the sale.

Trueman emphasised that the salesman must restrain himself from telling the client everything about the product too early in the sales cycle, otherwise he would lose the opportunity to keep in

touch and the means of finding out how the opposition was doing.

He proposed that bridges for communication should be established between the vendor's and purchaser's companies, to ensure that sources of information were tapped at the highest and lowest levels, to provide maximum feedback for the salesman.

"Show the client the computer room," he suggested. "Although computers look pretty boring, they represent an awful lot of money."

The same principle should also be applied to the customer's particular areas of interest: if he was concerned about future developments, he should be shown the development team busily coding, even if the product was not due to be launched for 18 months.

"Don't give user visits until a short-list has been drawn up, because the prospective client won't know what questions to ask and a constant flow of uninformed visitors may spoil the user base," he advised.

Closing the deal, which was rarely the job of the salesman, as it was a waste of his time when contractual details were normally decided by management, was the time for pressure on the potential user.

Among the "carrot" incentives that could be used were special functions such as user group meetings or product-related seminars, but Trueman favoured "stick" incentives with penalties for not

signing now, such as an impending price rise, extended deliveries or heavily-booked training courses.

On the subject of salesmen themselves, Trueman said he expected over £400,000 worth of business to be brought in by each of his general ledger salesmen per year, although Elwyn Wareham, production manager of Systems Designers Ltd put the figure at between £30-40,000.

Wareham, speaking on sales organisation, said that a good rule of thumb was that the salesman should generate a minimum of three times his cost to keep in profit.

He also emphasised the need for constant feedback of information, and outlined the precarious nature of the software product sales manager's job.

"Software products are unlike almost any other product being sold in that their design costs are very high while their reproduction costs are negligible," explained Wareham. "The effect of this is that extra sales go almost directly on to the bottom line: unfortunately the converse is also true, that shortage of sales means an equivalent shortage of profit."

Colin Bunfield, sales manager of Logica, examined terms and pricing policies relative to the licensing or leasing arrangement. He estimated that the proportion of costs expended on the sales and marketing operation could be as high as 40% in a typical company.

Package aimed at exporters

A MICRO system aimed at an estimated 20,000 active UK exporters will be available at the end of June from the Simplification of International Trade Procedures Board (SITPRO).

Funded by the government, SITPRO was set up to establish common standards of export documentation for international trade, and to supply information for the design and implementation of application packages relating to export. Its launch of a micro-based export consignment processing and invoicing system fills a gap at the lower cost end of the market, where demand is increasing.

Called Spex, the package caters for "ro-ro" (roll-on, roll-off ferry),

The Spex system provides export documentation.

deep sea, air and postal shipments, and can be used by almost any company or industry. It is menu-driven to aid the first-time user, and data may be extracted from disc files holding information on consignees, freight forwarders, products or declarations, to save keying-in time.

Information is held on a consignment record, from which documents for invoicing, surface and air transport, parcel post and Customs clearance can be generated. The data can be output to disc for reformating.

Written in CIS Cobol, Spex runs on any microcomputer supporting the CP/M or CPM 85 operating systems, and any others with CIS Cobol compilers. It costs between £250 and £300 to end users.

SINGAPORE... Three-year computerisation programme...

9,000 DP people needed by 1990

RAPID expansion of the computer services industry in Singapore has created a severe shortage of computer personnel, estimated at 1,000. The result: rampant job-hopping and a spiralling wage scale for the industry.

Recent estimates indicate that if the present trend goes unchecked, there may be a shortfall of up to 9,000 by 1990.

To make matters worse, presently 35% of the 1,000 data processing staff in Singapore are attached to either the Ministry of Defence System and Computer Organisation, the National Computer Board or the government's own software house, Singapore Computer System.

As a short term measure, the government has recruited 300 Asian graduates from the UK, Australia and New Zealand. It also offers computer science annual scholarships at some of the top universities in the West worth up to £9,000: Cambridge, London and Manchester (UK), Harvard,

Yale, Cornell and UCLA (US); and Alberta, McGill and Waterloo (Canada).

The National University of Singapore has expanded its computer science department to cater for the enlarged student intake.

The government has also carried out a three-pronged attack to tackle the long-term shortage. From the Sixties joint technical training schemes with the various multinational corporations — Philips, Rollei (now in liquidation), and Tata — the government has graduated to form joint venture training institutes with foreign governments. This provides greater resources and access to higher forms of expertise that are normally beyond the scope of a company.

The Japan-Singapore Institute of Software Technology (JSIST) is a joint venture project to train up professionals to form the future core of software manpower.

On the hardware side, in collaboration with the French govern-

ment, the government has set up the French-Singapore Institute of Electro-Technology (FSIET) to produce skilled electronics technicians. Even the mechanical and production side of computers is given a boost through the German-Singapore Institute of Production Technology (GSIPT). Based on the German system of technical training, this teaching factory will introduce more advanced expertise.

Other attempts to bring a greater awareness of computers take place at community centres, some companies and government departments. Apple, for instance, loaned computers for staff to use at home.

On a less generous level, top civil servants are given 5% low interest loans of up to £1,500 to buy computers for use at home.

But the greatest impact will be felt at the school level, when by the end of 1982 the target of four computer science teachers and three microcomputers to each of the 171

secondary schools should have been achieved.

Singapore's trade unions have been renowned for their "responsibility". There were only 10 strikes in 1976, none in 1977 or 1979, and only one in 1980. One of the two industrial arbitration courts was closed down for lack of business.

On the issue of computerisation and the possibility of job loss, unions have, unlike their Western counterparts, adopted the attitude of "If you can't beat them, join them". The National Trade Union Congress (equivalent of the TUC) has set up small local computer training classes close to workers' homes to acquaint them with computers. This is to prepare for anticipated widespread use of computers in the manufacturing and service sectors.

In full employment unions have little difficulty in convincing workers to accept the change simply as a useful tool rather than a threat to their livelihood.

Here's a question for every computer supplier on your new short list:

"When my computer goes down, how long until it's up?"

You've been through it already. Ask this question and you'll learn how long it'll take the service engineer to arrive! Useful information. But, if you're going to depend more and more on your computer - which is what the short list is all about - not good enough. Not any more.

Why? Because CTL's transaction-processing computers now have **MOMENTUM**. So your question can be answered directly. Like this...

If you choose the **MOMENTUM** Fast-Recovery Option, recovery from a program failure will be instant. Full recovery from a power failure will take a little more than a minute.

If you then add the Mirror-Disk Option, a catastrophic disc failure need cause no downtime. Add the Dual-System Option, and, even after a CPU failure, your database is clean in a few seconds.

Isn't that the kind of answer you wanted?

Next question. Cost? Complete CTL systems start at about £50,000.

MOMENTUM options start at around £1,000. So your cost can be matched to your budget, and the time you can afford to be computer-less. Like an insurance policy.

You won't get an answer like that from anyone else. Because **MOMENTUM** is

unique in its flexibility and cost. Perhaps your short list should be even shorter. To be sure, contact CTL. With this coupon, if you wish.

COMPANY NEWS

Zygal is still dynamic

DESPITE City nervousness over some of the recent launches on the Stock Exchange's Unlisted Securities Market, Zygal Dynamics has produced a 27% rise in profits for the year ended March 1982. Turnover at Bicester-based Zygal rose 42% to £2.84 million.

According to Zygal director John Maclean, the company has invested heavily during the year in plant and inventories to support new distributorships with Digital Equipment and Fujitsu.

Despite this increased expenditure Zygal added £68,000 to last year's £252,000 to produce a final profit of £320,000 for 1981/2. This makes the company one of the better performers on the USM.

Maclean says that the full effect of the DEC and Fujitsu deals has not yet been felt by the company. Commenting on reaction to a slip in the half-year figures from the 1980/81 level of £163,000 to £116,000, Maclean said that the first half of last year had been exceptionally good and this year's first half exhibited the effects of the build-up of stock and staff for the additional distributorships.

Zygal's main business is still with its original Diablo distributorship, but the widening of the product range with the inclusion of DEC and Fujitsu is seen as a move to strengthen the company by diversification.

When the company floated its shares on the Unlisted Securities Market last year there was some criticism in financial circles about the "thinness" of its trading base and its dependence on the Diablo distributorship.

Despite the very good results the shares have moved very little, and are still hovering just below last year's placing price of 78p, reflecting continued investor caution until the new products are seen to produce results.

INVESTMENT planning and production in Japan are done on a long-term basis. And all the long-term planning hinges on the Fifth Generation project.

In a report on the Japanese computer industry, part of which was reviewed in these pages last week, Alex Stewart, a consultant with stockbrokers Henderson Crosthwaite, quotes an American company president.

"The companies that do a good job and perform well are going to prosper over the long term, not the short term. Many companies make trade-offs in the short run versus the long run, and this is not something that comes easily, I know, but want to encourage you to look at the long term because that's where the real money is."

The idea that short-term profit-seeking is self-defeating is hardly revolutionary, but it is vital to Stewart's context. His report is intended primarily as a guide to investors and financiers, many of whom, especially in the UK, have become mesmerised by the lightning success of American companies like Apple and Osborne.

Stewart says Japan's Fifth Generation Project is creating the commercial and technical environment in which the Japanese computer industry will work for the next five to ten years.

The Japanese company best poised to benefit from the changes which the implementation of the Fifth Generation will bring is NEC (Nippon Electric Company), says Stewart.

This may come as a surprise to those who are familiar with the view that Fujitsu is the technological leader. But Stewart says that NEC has provided the prototype strategy for all the other companies he reviews, including Fujitsu.

NEC was the first to understand

the importance of a stable supply of proprietary integrated circuits and the mating instinct of the digital signal. As a result it has been able to achieve leadership in both semiconductors and office automation equipment, he says.

The company is by far the biggest microcomputer supplier in Japan, with some 28% of the total market for small business systems. Stewart says that NEC maintains an extremely aggressive investment programme, which pays scant attention to the return on the bottom line.

Stewart identifies Fujitsu as the second most likely company to benefit from the Fifth Generation plan. But Fujitsu has been slower than arch-rival NEC to integrate and market integrated office systems, he says.

Fujitsu is a smaller company in every activity but mainframes, and, Stewart observes, has sought extra leverage from a series of OEM deals based on IBM compat-

ible hardware (including a very important deal with ICL).

Taking on IBM is the calculated risk to which the company has exposed itself, playing on its advanced chip designs.

Its other strength is marketing, which shows particularly in small systems and personal computers.

Stewart says that Fujitsu is particularly conscious of market forces, witness its ambitious deals with Amdahl, Siemens and ICL, in addition to its joint ventures with TRW in the States and Matsushita at home in the small systems field.

But the emphasis in most of the deals on selling larger machines leaves Fujitsu behind companies like NEC, Melco (Mitsubishi) and Toshiba in small business systems.

Stewart says Fujitsu should remedy this deficiency when its office automation factory is in production next year.

Not surprisingly, Stewart's third choice to reap top rewards from the Fifth Generation is Hitachi.

This company is one of the leaders in the race to develop a supercomputer based on fourth generation architecture, he says.

Looking at Hitachi's long-term strategy, Stewart says that more than its other Japanese rivals, Hitachi has sought to take market share from IBM by duplication and replacement. The vulnerability of this strategy was exposed when its former OEM customer in the US, Intel, went under in the wake of IBM's 4300 model launch.

According to Stewart, the emphasis on pursuing IBM has brought benefits in the shape of highly advanced hardware.

Hitachi clearly wishes to establish a better balance between its semiconductor based mainframe business and the new markets opening up for small business systems and microprocessor applications, Stewart says.

He summarises his view of Hitachi with the charming observation that the company chews steadily away at IBM's market, while de-

Japan's big companies to benefit from fifth generation

COMPUTER WEEKLY, June 3, 1982 11

by Kevin Cahill

Hitachi chews steadily away at IBM's market.

velopments elsewhere are threatening to "make such behavioural instincts extinct".

ONE way to advertise your success is to buy a Rolls Royce, as Gordon Lamond and Clive Bartram of Lambert Computing have done.

Their company, a systems house specialising in turnkey projects, which was set up in a back bedroom three years ago, reached £5 million turnover this year. They have opened offices in Los Angeles and New

York, and have extensive marketing and sales in the Middle East.

But success did not come easily. Lamond says that even three years ago, some computer suppliers would prefer to lose business rather than sell equipment to system houses who were, like Lambert, supplying "foreign" peripherals and software.

Lambert had to put in some very

late nights and produce very sophisticated software before the mainframe suppliers took it seriously. But it soon through.

To assist other would-be entrepreneurs in setting out on the same trail as Lamond and Bartram, and to help make initial financing easier, Computer Weekly and Barclays Bank are running a special conference on June

17 at the Royal Garden Hotel in Kensington, London.

Called First Time Financing, the conference is aimed at those raising money for the first time or in the early days of running their own company. Further details from Sue Bonnell, IPC Conferences, Surrey House, Throesley Way, Sutton, Surrey. Tel: 01-661 8040.

Tomorrow's printer. Yesterday's price.

There has always been one big problem with the General Electric TermiNet 2000 series matrix printers from Zygal. It's not that they're a new breed of matrix printers, so advanced, so functional that's the problem. Their reliability has never been questioned. It's true that they are very quiet in operation, easy-to-use, easy-to-carry. The sleek clean lines complement all decors. Fewer moving parts. A choice of 60cps and 150cps models in either keyboard or receive-only configurations. Each with higher print quality, including descenders and underline.

So, what has been the problem? Cost. Considering their performance, the TermiNet 2000 series matrix printers from Zygal have always been excellent value. But, now, they are available at around the same price as other more basic printers. But only from Zygal. And not for long. Send off the coupon.

Please send me: Further details on TermiNet 2000 series ☐ Details of other products from Zygal ☐

State the goals, not your ideas for a solution

TECHNIQUES are the optional methods, products, ideas and structures which we design into the system exclusively for the purpose of meeting one or more attribute goals.

Sometimes people make use of techniques in order to express their goals. This habit of communication can have the undesirable effect of binding the designer to the technique rather than the real goals which someone intended to express.

This "misuse" of techniques "I want a computerised system for production planning" rather than the intended goals ("Yes, well what I really want is a faster, more accurate and more integrated production planning system than I have today") is partly due to ignorance.

We may be ignorant of the dangers of binding the people who are going to find us answers ("techniques") to the answers we assume. Perhaps wrongly, to be the best ones for us.

We may not be aware of an alternative language in which we can directly express our real needs (like a formal measurable system attribute specification language).

Let me therefore state some corollary principles to the Fourth:

1. If you want the best possible solution, then state your goals, not

your idea of how to solve your problem.

2. If you do state your goals in the form of a technique or technical solution, you will probably end up with a solution like that technique; even if it does not solve your problem.

If it does not solve your problem, then you have mainly yourself to blame.

We need to give explicit instructions to our design team, or problem solving team or experts, rather along these lines: "I don't want you people bound to the solution areas which my limited technical competence might accidentally suggest to you. I want the problem solved in the best and most imaginative way possible."

"I don't really care how unusual the solution may seem. I want the solution or solutions (there may be more than one, and we wouldn't want the design team to miss that point either) that best satisfy the goals I have stated."

There are an incredible amount of combinations of solutions to almost any problem. Our designers need to be free to pull together good sets of them. They need to be free of executive interference in their special area of expertise.

There is an incredible amount of new technology, both hardware and in terms of organisational ideas, which can be applied as so-

Tom Gilb is an independent consultant, lecturer and author on computing topics.

lutions to your problem. The rate of change and increase in this solution area is overwhelming.

You, probably don't know the best solution area, if you are the boss, even if you were a technical expert in the area a few years ago. And, initially, your own design team most probably do not have a final or a correct idea about the best set of solutions which you can possibly get at this time.

What you want to do therefore is to make sure that they will be free to scout the professional knowledge area in search of good solutions. Don't tie them down; free them to be creative in solving your problems.

Not only "don't tie them down" but make sure that they have the criteria (a well-formulated attribute goal specification) for recognising a really good solution when they bump into it.

And let them know that they can freely suggest "radical" ideas, when these ideas clearly meet your specified result (attribute) goals.

Tom Gilb

HUMAN TOUCH

When all is not what it seems

A SYSTEM in the context of a program product is an abstract concept. You cannot see a system, but you can see a system working.

Purchasing an abstraction requires a mental agility that salesmen cannot expect their customers to possess, so they resort to a demonstration of the system working. And demonstration of the system working has to be and should be all that those words imply. A demonstration is that it will not be the complete system. Working in the sense that any failure merely indicates that the salesman has not organised things properly.

The corollary is that there are parts of the system that have not been seen working.

The salesman is in charge of a demonstration. He decides what will be demonstrated, where it will take place and often what data should be used. The demonstration team should have been rehearsed again and again so that they don't have to think what they are doing while they keep up the patter with the prospective customers.

It is convincing but quite unnecessary for the normal production programs to be used for a demonstration. If the options in the production programs not required are removed then the programs will probably operate more quickly and may well run on a smaller machine.

Everything you see at a demonstration may not be what it seems. If the first thing a demonstrator does is to enter your company name to appear on output, do not

Cliff Dillaway

Cliff Dillaway is an independent consultant specialising in accounting, software, taxation and payroll.

assume just because that is what happens that he did so. A sensible salesman would have entered your name the day before and checked it out before you arrived.

Your demonstration will go through a number of stages, one leading on to another. Probably what you see is starting off fresh at each stage rather than using the data just created at the previous stage.

These demonstration techniques are not intended to deceive. The demonstration is intended to put flesh on the verbal explanations, the pictures and the brochures. Slip-ups, finger trouble and anything that can go wrong are just about the norm of every "first-time" on a computer.

The rehearsal, etc, are to provide the routine of a run-in system so that the viewer can actually learn something of the product.

Proving that things can go wrong is a fool's game, so remember that a demonstration is what that word implies: a demonstration.

Cliff Dillaway

FOCUS

Running out of control

CONTRARY to popular (and too book) belief, computer selection procedures are seldom limited to technologies. Weighted evaluation points are increasingly being scored on such matters as the financial track record of the suppliers, their R&D capabilities and their local and national presence.

Maps and balance sheets are playing an important role in selection. The DP selection team must take note not only of future enhancement paths but the local route map. User installations in Portsmouth, for example, would be encouraged by both the local supplier and company management to choose and support IBM.

And Putney users could hardly fail to take note of the presence of ICL, especially if their daily routine involved driving across Putney Bridge in the rush hour.

On a nationwide selection basis, IBM would forcibly point out that they are one of the largest employers in the UK computer industry. Burroughs, Honeywell and NCR would mention that the support large-scale UK manufacturing bases, while Unicom might be expected to restate its extensive R&D development facilities in the UK.

Senior management now expect the DP selection team to include financial assessment of the competing suppliers. Company management has been known to refuse its approval for the selection until data covering the long-term viability of all the contenders is supplied.

If the DP team is to retain its selection powers, then its approach to computer selection procedures must change. Less weighted points should be extended to hardware characteristics and performance, mips differentials and terminal modularities, with more weight allocated to user-friendly systems and office automation interfacing equipment.

In any case, many computer evaluation studies are now out of control. Selection panels total 11 or more individuals representing all DP areas and activities. Timescales are measured in months rather than weeks and in the case of State organisations, ten exceed 2,000 man-hours of involvement.

Presenting such elaborate reports to management serves only to underline the belief that the DP team is both out of its mind and depth. Blowing the chief executive's minds with reams of technical data and statistics could well blow the DPM's job, especially as, in too many cases, the production of extensive reports serves only to cover the initial prejudice of the inner selection team.

Anything more lavish than a single screen full of data is suspect and suggests that the DP team has not been able to evaluate the data wood from the data trees. A short, snappy report expressing confidence — the DP team in its selection, the supplier in his ability to deliver the goods, and the senior managers that they will spend minimal time on the project.

If such confidence is lacking, then company management will have little option but to bring in an independent consultant to assist the selection procedures. Given the complexities of the computer selection exercise, outside assistance could be an inevitable and desirable for all concerned.

IBM's reputation is at stake

IBM's attempts to control the introduction of its Personal Computer into the UK market have failed miserably.

Companies in the UK have shown they will go to extraordinary lengths to get their hands on the machine.

Officially, IBM has refused to acknowledge the demand. But because unofficial operators with an eye to opportunity continue to assume responsibility for marketing the IBM micro, IBM's own reputation is at risk. IBM is being dragged in whether it likes it or not.

Microcomputerland was the first UK company to announce that it had got around IBM restrictions on exports from the US of the Personal Computer. Microcomputerland has since fragmented into offshoots, Microland and Microcomputersource. While Microcomputerland continues to trade, Microland, under the direction of ex-sales director Doug Mudie, claims to have taken with it the original middlemen suppliers to Microcomputerland.

Meanwhile, Microcomputersource, a dormant company initially set up by Microcomputerland and recently sold off to two ex-members of staff, has emphasised that it is quite independent from Microcomputerland and gets its IBM Personal Computers from a different source.

Other self-appointed distributors for the IBM Personal Computer include KGB Micros and Northamber. Most offer add-on memory and peripherals, including Winchester hard disc drives, which brings to mind IBM's early competitive battles with the plug-compatible peripheral manufacturers.

To customers buying from such operators, the name IBM will be the one which sticks in their minds. If these customers get their fingers burnt because of a petty squabble between small businessmen setting themselves up as unofficial distributors, or because a peripheral packs up, it is IBM they will look to for arbitration.

IBM's official position is that it does not want to put a product on the market which it cannot support. Unofficially, it looks as though IBM is releasing its grip on those US suppliers who allow IBM machines which have passed through their books to find their way into the UK market, either unintentionally or deliberately by setting up strings of companies to buy and sell the machines.

The company is facing problems similar to those which rocked Apple with its European distributorship fiasco a few years ago, when nobody knew who the official Apple distributor was.

When the Personal Computer was released last year, there were great expectations that the market would be legitimised. To some extent that has proved true. Many of the companies which have so avidly sought the machine in the UK are big corporations which are keen to see if the IBM label will meet their future requirements.

But by leaving UK "distribution" — "test marketing" may be a more apt description — to any company which has the enterprise to import the machine into the UK, IBM has been caught in the seamy side of the personal computer market.

IBM finds itself with these UK problems because it cannot manufacture sufficient supplies to meet worldwide demand. It tried to skirt the problem by restricting the producer's release to the US. But it should be possible to step up production, even if the price is high.

In the meantime, while it may not be able to control the actions of unofficial distributors, it cannot ignore the fact that the demand for its Personal Computer is there and being met by non-IBM sources. IBM, to support its reputation, should consider making available in the UK the necessary support staff for the product. It may not be the way IBM planned it, and it may not be as profitable as the company would have wanted it to be, but it will save it some embarrassment.

It is now time for IBM to announce the Personal Computer in the UK and put an end to this confusing situation.

1984 and all that

THIS week's example of the strange things people say about computers was sent in by Tony Orme, of Aldershot, who wins £5. Mr Pearce and the other shop stewards have already had a crash course in computer programming. "It's a piece of cake," he said. "It's as easy as playing a TV game like Space Invaders."

LETTERS

Keep the patient alive

SOFTWARE File (CW, May 20) is quite right to say that software houses will be making a killing on payroll packages. However, there is an incipient symptom that may well turn on them in statutory sick pay.

Statutory sick pay comes into effect in April 1983. Anyone buying a payroll package today would be foolish not to require that they receive the necessary enhancements in good time and free of charge.

The detailed requirements for statutory sick pay will not be published until July. The computer requirements will be non-trivial. It

may be difficult to fit those requirements into the available program space in memory or for the extra file data to be stored on disc.

Calculating and keeping track of statutory sick pay (it may be recovered against NI contributions) will be such a chore that software houses will eventually benefit enormously. In the meantime users and suppliers need to take care that remedial treatment can be provided that will keep the patient alive and working.

Stroud, Gloucestershire

CLIFF DILLOWAY

Micro ledger 'cowboys'

CHRIS YUETT's comments on micro ledgers made by cowboys (CW, May 13) strike some chords with us.

In pursuit of the micro market and offering a turnkey on equipment, systems and support we encounter two or three situations every month involving confused and angry would-be users — "would-be" in the sense that they have bought kit and standard packages normally very cheaply and have failed to get systems up and running.

This is due in part to limitations of the package but also from a total lack of support and "hand holding" in the important early stages.

In the important small business market our industry must realise the importance of strong systems and close personal attention to customers' needs. It costs — but the result is satisfaction, a good reference, and a continuing association with the client in succeeding years.

Scots' micro education

DAVID HEARST wrote (CW, May 6) about the history and problems of the Scottish Microelectronics Development Programme. While I would agree with much of what was said, I feel that it creates a false picture of the overall state of educational computing in Scotland since SMDP is only one element of the total network.

Indeed, most of the problems which have been described have arisen because SMDP has been expected to be all things to all men. In Scotland, as well as in England and Wales, the central agencies may encourage and monitor changes in education, but it is the local authorities which finance, initiate and control almost all the developments.

Local authorities have provided most of the hardware, facilities and manpower currently being used in the development of computing in their schools and colleges. This is not to supplement a lack of central provision, but because this development is seen as being a priority by the local education committee.

I therefore enclose an article describing the current situation in Scotland which I hope you will publish in an attempt to correct any misunderstandings created by Hearst's article. I have refrained as far as possible from adopting the

role of apologist for SMDP, because there have already been too many public arguments about the failings or otherwise of SMDP.

University tests VDU guinea pigs in their natural environment

MY regular reader will no doubt be aware that I have often gone on at great length about the health aspects of working with VDUs and associated new technology. So when I received an invitation from the British Computer Society to sit in on a meeting of the displays group, entitled "Where do you put your coffee?", I felt obliged to attend.

Two of the speakers, Peter Howarth and Howell Istace of the Institute of Consumer Ergonomics at the University of Loughborough, are currently involved in a survey to identify what problems office automation introduces. Over 200 subjects at six sites using

VDUs and six with conventional office equipment are being tested for both eye problems and physical discomfort for a complete working week.

By means of both physical tests and questionnaires, Howarth and Istace hope to highlight the differences between the two working environments. Different job types will also be investigated; as Istace says: "The time spent looking at a VDU varies greatly with the type of work being carried out - audio typists using a word processor spend more time looking at the display than do copy typists."

He claims that this is one of the critical points often overlooked

when investigating VDU-related health problems. Another difficulty lies in the fact that there are many problem factors involved with the introduction of new technology and the humble VDU is only one of them.

"Computer systems introduce change, not VDUs," says Istace. The Loughborough survey will investigate such parameters as the general level of office lighting, the amount of detail read from the screens, glare, reflections, noise and the office climate.

In addition to the comparisons drawn between the six conventional and six automated offices, a special study of workers who alternate between word processors and typewriters will be carried out. The subjects will provide unique data in that they form their own controls, enabling an accurate measurement to be made of the differences encountered between the two technologies.

Howarth claims that this survey will prove to be invaluable in that it involves subjects performing their normal jobs in their normal working location. Previous investigations have tended to be more laboratory-oriented, which may throw their results into question.

"The whole visual system must be measured," says Howarth.

"Not just the eye - the brain must be included - if you have your leg amputated you can often still experience an itchy toe. Perception lies in the brain, not the eyes or ears."

So what handy hints for comfortable use of VDUs came out of the meeting? One on which all the participants agreed was that in a multi-screen environment, all displays should be the same colour - eyestrain is more likely to result from the colour differences.

This must call into question the current trend for mainframe ops consoles operating in glorious technicolour - any sufferers out there?

The golden rule to apply when using any VDU is that the character size should be at least one hundredth of the eye-to-screen distance. One speaker announced that certain displays - stroke refresh, where the entire screen is repainted seven times a second - are the worst offenders when it comes to eyestrain and headaches: "They quite often have a sticker on them which says 'Do not use this screen for more than three hours'."

All in all, an interesting meeting, but I still don't know where to put my coffee.

For Adventure-seekers

DESPITE the Dungeon Master's threat a few weeks ago to reduce me to a heap of ashes for helping you with your Adventure problems, here is another batch of questions. (Good lord, does this man know the meaning of fear? Ed.)

Bridget Harrison from Oxford asks how one returns from the island with all the treasure (sapphire, portrait, rug and ZS note), without sinking the beautiful peacock boat? Bridget is also concerned as to what (if anything) one does with the ZS note.

This sounds like an Adventure derivative - I don't remember an island in the version I used.

Now for something in which you can possibly help me. Several people have contacted me recently asking for a source for Adventure or Dungeon. I have also received offers of new versions.

Now, the people offering copies could not cope with the flood of faxes which would not descend on them were I to publish their names, and, much as I like to admit it, I don't have access to a computer myself.

But with people offering me copies, and others wanting lists, there is some way of bringing them together? Suggestions on a postcard please.

by Philip Hunter

No sausage-machine solution with coding

IT is still impossible to lay down the design for a large complex system, and have the computer generate the code and documentation. There are simple systems where a goal can be specified, a proverbial handle turned, and an algorithm produced, but these fall short of converting complex needs into detailed design.

A more likely path towards the automatic system builder lies in following the example of the data dictionaries, which provide the ability to build networks of information about a system.

One such system has recently been offered to its users by Sperry Univac. Developed for internal use only, it was later deemed safe and reliable enough for general consumption. Sperry claims that it is far more than a data dictionary, giving users the chance to match the requirements of a system with the realities of the detailed design down to the exposition of algorithms in pseudo-code, the specification of parameters and the return of values by subprograms.

Before examining the strengths and shortcomings of Univac's new tool, it is worth looking at it in some detail.

It consists of a Requirements and Development Processor (RDP), and a language called RDL, which enable the design of a system to be built in a hierarchy of elements which refer to other elements at higher and lower levels.

As it is possible for more than one element at one level to refer to the same element in the next level up or down, networks can be created. Usually, however, RDL will be used to reflect the "top-down" design of a system starting with a single lead element and yielding a hierarchy.

The finished database can be updated by redefining an element, or can be interrogated to elicit information about an element. An example in the case of an element which relates to several subprograms might be the name of the group assigned to code it, and the number of man-days allocated.

The base can also be used to provide documentation. Each element can have a title specified, and a general description can be as long as the space available allows.

At the bottom of a hierarchy

comes the exposition of algorithms in pseudo-code, which can be incorporated in documentation. The element which includes the algorithm description can also provide information about its purpose.

This can be useful in making comparisons between the system as described in the database, and the fictitious system in the mind of the designer.

In fact, this is the chief wisdom of RDL: it enables a specification to be verified. Clearly the system will not allow entries inconsistent with its axioms, like for example two elements each specifying the other on a lower level.

The system will provide some cross-reference, such as a list of subprograms or procedures that are affected by a particular algorithm or invoked by another subprogram.

So RDL allows a model of a system to be built, but does not offer any testing, or integration of code. Nor does it perform any automatic updating of elements affected by changes made elsewhere.

At least RDP makes no false claims, and is certainly a workmanlike tool for developing large systems involving much manpower.

For example, RDL does not provide detailed analysis of the progress of the project down to the last subprogram. All it can do at present is accept textual data of progress which can be updated, say, every week.

Still, the idea of linking all levels of system development is a good one. There is the prospect of automatic verification of each level of design, eventually culminating in the integration of programs into the whole system.

Given the fact that you can identify all ten of the letters in this alphabetically ordered sum? See page 37 if baffled!

Sales team reshuffle at Storage Tech

THERE have been several substantial changes in sales and marketing at Storage Technology in the US.

The position of vice-president of world-wide marketing has been created, and is held by John Scott. He is replaced as vice-president of Western area operations for domestic sales by Daniel Ellis,

previously vice-president of marketing.

Former manager of product marketing Gary Holtwick has become division vice-president of productive marketing. James Preston has been elected an officer of the company by the board. His title of vice-president of Eastern area operations for domestic sales remains the same.

Zilog top men

ZILOG has appointed former Signetics general manager Franc de Weeger president and chief executive officer. He replaces Manny Fernandez, who left Zilog to form a new company.

De Weeger was director of materials, at National Semiconductor in Santa Clara, California before joining Signetics in 1979. Before that he was a director of Motorola's semiconductor group.

Now, the people offering copies could not cope with the flood of faxes which would not descend on them were I to publish their names, and, much as I like to admit it, I don't have access to a computer myself.

But with people offering me copies, and others wanting lists, there is some way of bringing them together? Suggestions on a postcard please.

CENTRONICS Europe vice-president Terry Harris raised over £2,000 for the Save the Children Fund when he successfully completed the London Marathon in 3 hours, 2 minutes, 2 seconds. It was something of an achievement for Harris, who had never run in a marathon before and who was labouring under the additional handicaps of an injured ankle and strained hamstrings. He was sponsored by a number of companies and individuals, including Centronics.

Midlands school quiz

TWENTY-ONE schools entered the West Midlands Computing Group's quiz competition this year, answering questions which ranged from "What is the name given to a single binary digit?" to "What is the name of a system of workstations connected to a central master computer and backing store?"

The contest was won by Bishop Vesey School, Birmingham, which received the IBM Schools Computing Cup, a cheque for £100 and a Sinclair ZX81. Team members - seen here with IBM schools liaison officer Norman Longworth: Stuart Cheshire, Nicholas Tingle and Andrew Jones - were awarded pensets from IBM and a book from IT&T.

The winning team from Bishop Vesey School with Norman Longworth from IBM, who presented the prizes.

Jack Boardman has been appointed sales manager at RUT Business Equipment. He was formerly dealer sales manager at TEC (UK).

Philip Hamer has joined the defence systems equipment arm of Plessey as director of overseas operations. He was formerly defence electronics specialist consultant at PA Management Consultants.

John Coe has become a senior consultant with Reed, Stead, Morrell. He will specialise in VM, DOS/VSE and multiple 4300 environments. He was previously technical manager with P&O Computers.

Richard Price has been appointed an executive director of European Marketing Consultants. He was formerly communications manager at Nexos.

Martyn Collinson of Consultants (Computer and Financial) has been promoted from sales manager to marketing director.

Peter Boyce is sales support engineer for Engineering Computer Services, responsible for the area between London and Birmingham east of the M5. He was formerly an application engineer with Société Générale at Newport Pagnell.

Ian Hearn-Phillips has become European technical support manager for Winchester drive manufacturer Priam, and is based in Reading. He was previously with Tandem as international product support manager.

Tim Shears has joined MSA as a systems consultant, from Forest Accounting where he was senior accounting recruitment consultant.

A Digital Authorised Terminal Distributor will get our terminals to you in 24 hours.

And we'll service them in 4*

At Digital we've always been proud of the fact that we sell more printer and video terminals than any of our competitors. With a range to cover most requirements.

But now whether you want 50, 5 or even just one terminal, not only will a Digital distributor be quite happy to oblige, he'll also give you a free quote and delivery within a day.

And because there are fully trained specialists and a demonstration centre on the premises, he'll also be able to give you well-informed advice as to which terminal is best suited to the specific job you have in mind.

But whichever terminal or terminals you choose, you'll benefit from our automatic 90-day Digital warranty and the option of our fast, low cost service. Our field service vans are all capable of carrying out even major repairs.

So whatever your terminal requirements are,

we're certain any of our Authorised Terminal Distributors will give you more than you might expect elsewhere.

We change the way the world thinks.

The rules of regional development policy keep changing under successive government administrations. In this four-page special report, DAVID CASEY highlights the various grants and development support schemes available from local and central government in four regions.

How changes in regional aid rules have held back Britain

LIKE the ball in a political tennis game between successive governments at Whitehall, regional policy has changed direction with monotonous regularity since the war. Not content with playing to a single set of rules, Ministers feel free to change the size of the court - and the scoring system - while the game is in progress.

While no government with an eye to the ballot box would admit this was true, constantly changing regional assistance programmes may actually serve to defeat the objective for which they were created. Yet the approach to regional aid is a key element in national economic strategy: for almost 40 years, complete regions have constrained Britain's rate of growth.

By 1945, six years of military production had taken their toll on the industrial structure of Britain, accentuating the economic problems created a decade earlier. An apparent surge in industrial production concealed pockets within the national economy where output had declined and unemployment was again on the increase.

A system of grant aid for companies moving into these underprivileged regions was the Attlee government's response to the problem - a measure replaced largely by

tax allowances by the Conservative administration of 1951. Whatever the nature of the financial carrot, however, there was a corresponding stick: to be awarded in Whitehall, Factory building in the economically stable London and South-east became subject to development permits designed to discourage major new projects.

Declining demand during the 1960s for shipbuilding, coal and steelmaking did little to stimulate development in the UK's assisted areas. More positive action, in the form of grants up to 45% of capital cost under the 1966 Labour government, immediately attracted companies to the priority regions, but created areas of economic blight in their wake.

On one side of the regional boundary business appeared to thrive, while only a few yards away, factories were idle for the lack of incentives.

Progressively graduating the assistance available to a region has helped to remove many of the anomalies of financial assistance, and is the vehicle used to fine-tune local economic conditions. Special Development Areas qualify for maximum assistance, attracting 22% capital grants for buildings,

tax allowances by the Conservative administration of 1951.

Until measures introduced by Sir Keith Joseph as Industry Secretary in July 1979 reduced the grant for basic Development Areas by 5%, to 15%, these locations were broadly comparable to SDA regions. Rather than increase the statutory aid to the SDAs, the policy of the present government has been to reduce the assistance elsewhere, increasing the margin of incentive.

Prior to 1979, Intermediate Areas - a band surrounding most Development and Special Development Areas - qualified for automatic capital grants, but this concession has been reduced progressively so that new investment after August 1982 receives no grant from central government.

All three classes of assisted area are still eligible for selective assistance, a provision of the 1972 Industry Act. There is no automatic right to funding: a company must demonstrate that the investment would not otherwise have been made, that it would have been at a lower level, or delayed. Discretionary grants to encourage employment are awarded on a similar basis, the criterion being that a company moving to an assisted area has a genuine choice

between locations and would not proceed as proposed without financial support.

The taxation position of regional funding depends on the source. Statutory grants for SDA and DA investment are not deducted from the total cost before tax allowances are calculated, so that the net cost of a project is reduced still further. For every £1 of gross investment in an SDA by a company paying 28% corporation tax, the real cost is reduced to 20p. All other forms of assistance are treated as trading income, however, increasing a company's total liability for tax.

Among the miscellany of aid for which a business might qualify are loans on preferential terms from the European Coal and Steel Community fund in the EEC Areas in which either steel or coal was once dominant activities attract finance as an aid to reducing the critically high levels of unemployment which prevail there.

Adding Enterprise Zones in 1980 to the list of regional incentives has allowed the government greater flexibility to pinpoint areas for assistance. Critics maintain that the Enterprise Zone concept - in which companies are given ten years free of rates and receive only nominal planning permission - is a blunt instrument. The objections raised are two-fold.

With such a concentration of incentives on an area as small as 400 acres, a surrounding band many times that size will fall rapidly into decline and create even more unemployment. No less a criticism is that the benefits will not be passed directly to the company moving into the zones. In the absence of rates, freeholders will raise their rentals and reduce the net saving to the tenant company.

Since Enterprise Zone status is additional to SDA, DA or Intermediate Area assistance, there are localities on mainland Britain - such as Speke on Merseyside - which qualify for 22% grant, selective funding and a 10-year rates remission. These attractions pale into insignificance, however, when compared with Northern Ireland incentives.

payers - who are not shielded by a Whitehall subsidy - are faced with supplementary demands ten years' freedom from rates is a major advantage.

The prospect of a daily journey by road through the East End could take just a little of the gloss off an Enterprise Zone job. London Underground stops short of the West India Docks and outline plans for extending the network have been shelved. Conscious of the implications that this could have for employment in the area, the Docklands Development Corporation is currently examining submissions for a light rapid transport system, which would link the Enterprise Zone with an underground line to the City.

In the short term, an express coach service will be provided between the site and Mile End on the District Line.

With proximity to the centre of London as its most obvious attraction, the Corporation is confident that demand from companies wanting to move on to the site will exceed the space available. It will therefore be in a position to exercise careful control over the type of industry it accepts.

There will be no sterile expanse of warehouse employing three men and a robot stacker, and the area should avoid the mushrooming of world headquarters attracted only by the Enterprise Zone. Indeed, the London Docklands have a future - one in which the computer industry could play a vital role.

Computer industry's vital role in injecting new life to London Docklands

FOR more than 30 years after the Second World War, successive governments confined their regional policy to the "problem" areas of the UK, where industrial decline had led to severe structural unemployment. Relative to the depressed areas of Tyneside and Merseyside, London and the South-east enjoyed full employment and required no positive assistance. Indeed, factory building within a large radius of London required an Industrial Development Certificate as a constraint on indiscriminate expansion.

It is ironic, therefore, that the most significant element in this government's regional strategy evolved from a speech on the London Docklands by Sir Geoffrey Howe when the Conservatives were in opposition. Introduced as a feature of the 1980 Budget speech, Enterprise Zones were conceived as a positive attempt at regenerating carefully defined areas.

In sharp contrast to the subsidies and grants available in more

traditional development areas, the assistance envisaged for the Enterprise Zones was to take the form of an abolition of planning restrictions and relief from local authority rates for ten years.

The existing priority areas have attracted their fair share of Enterprise Zones. There is one on Clydebank, one in Swansea and one in Hartlepool, for example, with a further eight zones taking shape throughout the UK.

Of these, the scheme developed for the Isle of Dogs is exceptional in that it is the first attempt by a government to attract new business into the South-east.

The London Dockland does not have the status of a development area, so that it cannot attract new business with conventional regional assistance. But the package of fiscal and planning incentives available to companies in any of the Enterprise Zones will have a marked effect on the future of London's East End.

Under the chairmanship of Nigel Brookes, the London Docklands Development Corporation is

the organisation with the daunting task of injecting new life into the area. It was set up ten months ago and will eventually take on the full powers of a new town development corporation. In that capacity, it was formally invited by the Department of the Environment last month to start procedures leading up to the creation of a 475-acre Enterprise Zone centred on the old West India and Millwall Docks.

The zone was officially designated in April and formally opened by Sir Geoffrey Howe on May 21.

There is little to suggest that the expanse of dock basins and dilapidated warehousing left vacant in 1980 will ever become a dynamic industrial centre. It is even less conceivable that the skills on offer from redundant London dockers could be fully utilised by companies moving on to the site. But reducing local unemployment is not the main objective of the Development Corporation.

For the area to regain and then sustain a stable economic base, it is vital that companies in growth in-

dustries are encouraged to move to the Docklands Enterprise Zone.

So often with "economic revival" plans, the influx of business to a development area falls below expectations. In the case of the Docklands scheme, the optimism of the Corporation is already being borne out by the range and strength of the companies which have applied to move on to the site.

The film studios of Southern Television, for example, will be relocated there and will provide a nucleus for a "cottage" video and recording industry.

In terms of the capital invest-

ment in the site, Telegraph Newspapers is perhaps the largest company involved in the project. It is estimated that close on £80 million will be involved by the time its site has been developed and the plant installed.

With severe unemployment among teenagers in Tower Hamlets, there is every possibility of bringing local people into ancillary jobs on the site.

To complement the commercial activity in the Enterprise Zone are plans for establishing a national indoor sports centre within the Isle of Dogs complex. This is just one of the proposals designed to prevent the area becoming another dull and uninspiring industrial estate. The docks basins are to be left intact, for example, with quayside development along the lines of St Catherine's Dock.

For companies prepared to help develop the Isle of Dogs, the principal attraction must be the 100% write-off available on new buildings. Simplified planning procedures will greatly assist these firms and be an even greater incentive to the tier of smaller businesses needed to provide a balanced industrial profile for the area. It is envisaged that land for development will be available on long-term leases, either for a single premium, or financed through ground rent.

Central government curbs on local authority financing have been followed by sharp rises in rates. At a time when commercial rates

are faced with supplementary demands ten years' freedom from rates is a major advantage.

The prospect of a daily journey by road through the East End could take just a little of the gloss off an Enterprise Zone job. London Underground stops short of the West India Docks and outline plans for extending the network have been shelved. Conscious of the implications that this could have for employment in the area, the Docklands Development Corporation is currently examining submissions for a light rapid transport system, which would link the Enterprise Zone with an underground line to the City.

In the short term, an express coach service will be provided between the site and Mile End on the District Line.

With proximity to the centre of London as its most obvious attraction, the Corporation is confident that demand from companies wanting to move on to the site will exceed the space available. It will therefore be in a position to exercise careful control over the type of industry it accepts.

There will be no sterile expanse of warehouse employing three men and a robot stacker, and the area should avoid the mushrooming of world headquarters attracted only by the Enterprise Zone. Indeed, the London Docklands have a future - one in which the computer industry could play a vital role.

Digital assembles computer systems to individual requirements at its Moshill plant in Ayr. It recently bought its factory, and a 65-acre site for expansion.

National Semiconductor employs 700 at this Greenock factory, and has a £22 million expansion programme to add 80,000sq. ft. of manufacturing space.

Electronics holds out hope of recovery for Scottish people

TO the desk-bound Londoner, the North starts at Watford. On this scale of reckoning, Scotland is far beyond the borders of Betjeman's Metroland; a country where shipyard cranes tower over busy dockyards and factory chimneys are the sign of a thriving manufacturing industry.

Few economic analysts North of the Border would agree with this impression of the regional economy. Mounting unemployment is a grim reality, as traditional industries rationalise or become uncompetitive in the face of subsidised imports.

The problems facing Scotland have, however, been recognised by successive governments. Under Whitehall's regional assistance policy, Development Areas were designated when the concept was first established. These have subsequently been upgraded to Special Development Area status where conditions are most acute, offering 22% capital grants and comparable incentives for job creation.

To the people of Scotland, the

With the emphasis on attracting high technology to the region, the project has a specialist electronics team with direct experience of the industry. The aim is to strengthen the existing base of 200 companies from this sector, employing more than 40,000 people. In terms of these companies' "pedigree", about two-fifths have their principal operations elsewhere in the UK. A similar proportion are from overseas countries, while the remainder are indigenous Scottish enterprises.

Scottish higher education has a long history of involvement with industry: its role is now shifting rapidly towards advanced computing and electronics. Relative to their English counterparts, the country's universities have a higher proportion of students in engineering, scientific and business subjects.

Edinburgh University, for example, is closely involved in electronics through the Wilson Institute, where research is currently being undertaken in integrated circuitry and artificial intelligence. The city's second university, Heriot Watt, claims one of the oldest science parks in the UK.

Helping to establish links with the education sector is seen as a prime task for Locate in Scotland over the next five years. For a company moving to the region - or attempting to expand an existing site there - this practical assistance complements the statutory and discretionary financial support available in Scotland. While Locate in Scotland has no influence in the payment of regional development grants (a company qualifies simply by being there), the team can assist with the documentation.

When funding is selective, central government resources hinge on a company demonstrating its viability, and the fact that without the support expansion would either not take place, or it would be in another country.

The role of Locate in Scotland is particularly critical when Scottish Development Agency finance is at stake. Current policy is to take only a minority involvement in a company, rarely more than 25% of the equity. Where preference shares are taken up, however, the SDA may take up a significantly greater proportion.

Under no circumstances would the Agency seek to become the majority shareholder, preferring instead to invest alongside commercial banks and insurance companies.

David Wilkins, marketing manager of the Locate in Scotland project, outlined the SDA's objectives in making an investment. "We normally look towards holding an investment for five to seven years, and then sell our stake back to the prime movers. We see our funding as an influence in bringing people into Scotland, rather than a subsidy - the SDA is required to make an economic return on its

investments." Under competition from other UK regions, Scotland's unique selling point is a good operating

environment rather than as an area which can offer the highest cash returns. The fact that some parts of Scotland do qualify for the high-

est level of grants, European Coal and Steel Community funding and rent free accommodation, is a bonus.

Wilkins contrasts his organisation's marketing approach with that of the Welsh Development Agency - much in evidence through its television advertising campaigns. "We are tending to concentrate on particular sectors where we think Scotland has an established track record, a good basis of research and a first-class skill base. While we are keen to attract computer applications, we do not have to employ non-target generalised advertising."

a move in the right direction...

Every Rush & Tompkins Developments' scheme is based on a strategic location, design flexibility, competitive pricing and a very high standard of construction. All the Company's developments are close to major business centres and growth areas, with easy access to most national trunk roads and motorway networks.

Rush & Tompkins Developments can offer you sound professional advice in solving the problems of space, by providing a wide range of properties for many diverse operations - including shops, offices, warehouses and factories. Service is top priority, and the

development team is closely involved at every level, from planning permission to Incentive Grants, from letting to total site maintenance.

Industrial Commercial and Retail Developments

Industrial: Croydon, Surrey; Cullompton, Devon; Chelmsford, Essex; Deyford, S. London; Edinborough, Kent; Greater Manchester; Hayes, Middlesex; Melbourne, Cambs; Merseyside; Newcastle-on-Tyne; Tyrrford, Berkshire.

Retail: Bromley, Kent; Reigate, Surrey; Walthamstow, E17; Bristol, Avon.

Commercial: Bromley, Kent; Reigate, Surrey; Bristol, Avon.

Service is top priority, and the

Lack of direct cash grants is no handicap to South-west

PROMOTING a region of the UK which can offer no development grants, European assistance or subsidised accommodation might appear an unproductive task. For the team at Bristol Economic Development office, marketing the attractions of Avon County presents a stiff challenge in the face of competition from South Wales, Scotland and the Irish Republic.

Until the lifting of Industrial Development Certificate requirements for non-assisted areas at the end of 1981, Avon suffered an additional handicap in that new factory building was subject to IDC constraints.

Abolishing Development Certificates with the minimum of publicity from Whitehall has done little to improve industrialists'

awareness of the region in the short term.

Despite having the odds stacked against it in terms of incentives, Avon County has been successful in attracting new business. The decision by Hewlett-Packard to develop a 165-acre site immediately to the north of Bristol City suggests that direct cash grants are not the most important consideration.

Mike West, economic development officer for the City Council, maintains that regional assistance has a relatively low priority in most companies' decision to relocate. "When we talk to management, it becomes clear that the offer of finance is only attractive if every other factor is right."

Easy access to other centres of commerce and industry in the UK is one incentive heavily promoted by West and his team. With London 70 minutes away by train, Bristol does not suffer the geographical isolation of Scotland and the assisted areas of North-east England. A provincial airport at Lulsgate provides limited facilities for airfreight, but Heathrow is directly accessible on the M4 motorway for international passenger traffic.

As a county, Avon is a product of the 1972 Local Government Act. By far the largest of the six administrative districts within its borders is Bristol - before the reorganisation, a county borough with total control over the facilities it provided. Despite being stripped of responsibility for key services, including education, the city still dominates the economy of the county.

A prominent feature of economic development in the area has been the establishment of industries closely dependent on each other. Tobacco, packaging and printing evolved jointly and stimulated the engineering industry producing machinery for these first-line activities. High taxes on tobacco products - and successive health campaigns - have therefore taken a heavy toll on local employment.

A second industrial grouping, aerospace technology, provided employment in the area for skilled technicians, engineers and support staff, but this cannot guarantee long-term economic stability. Once the home of the Concorde project, British Aerospace at Filton is totally dependent on Whitehall contracts. Public expenditure cuts are therefore reflected in the pattern of unemployment.

To the local authorities in Avon County, attracting a handful of major high technology companies from a narrow sector of industry is a two-edged sword. While radically reducing surplus labour capacity in the short term, such a strategy could expose the region to further problems if the structure of the UK microelectronics industry were to change as a result of foreign competition.

Merely to be involved in high technology is no guarantee to viability, as the failure of the Nexos office systems project in Bristol has illustrated.

Drawing a cross-section of electronics and computing companies into the area is the prime objective of Councillor Claude Draper. As leader of Bristol City Council, and chairman of the Economic Development Board, he has a dual responsibility for attracting new business from the UK and overseas.

Draper emphasises the importance of Bristol as a commercial centre capable of supporting companies that the Development Office is attracting. "For a busi-

ness to succeed in an area, it may be able to draw upon the support of banks and insurance companies, and find experienced clerical and administrative staff. This is where Bristol has distinct advantages over local development areas in South Wales."

With a policy of office development during the 1970s, Bristol attracted major insurance companies to the city: the strength of the financial community in its county is exceeded only by London and Edinburgh.

Land for factory development in the county is available from the local authorities, and from private industry releasing surplus sites. The Imperial Group, whose Wilton subsidiary is constructing, and the Rio Tinto Zinc Corporation provide the major sources of land in the private sector. British Gas and British Rail are among the public authorities with property surplus to requirements.

Serried ranks of factory units on a trading estate may be one solution to development, but can do little to stimulate the environment which encourages companies to establish long-term roots in a region. The Aztec West development in Patchway, at the M4/M5 junction to the north of Bristol, has been designed to overcome the inherent objections to factory estates. A commercial development on land assembled by North Avon District Council, Aztec West ("A-to-Z technology") is planned as 1.5 million sq.ft. of industrial and warehouse space and a further 500,000 sq.ft. of offices.

Guy Morton-Smith, development director of Aztec West, believes that the balance of industrial and commercial units will avoid a stereotyped trading estate image.

DEC is the first major computer supplier to take space at Aztec West, with a 24-year lease on 30,000 sq.ft. of office. The company has an option on a further unit of the same size to cope with expansion. Since Digital is planning to move its Bristol branch and service staff to the new business is not being brought to the area. Bristol development officer Mike West is confident, however, that the total "environment" package he can offer throughout the county will attract real investment and new job opportunities.

To the South-west of Avon, away from the established industrial environment, the prospect of attracting high technology investment rapidly fades. Journey time of road and rail travel increases in proportion to the extra distance added to the real cost of production in the region. Touring industry rarely decreases the level of unemployment, but the labour force available to a prospective employer lacks the blend of industrial and commercial skills required.

A combination of SDA, DA and intermediate areas status is the attraction that Devon and Cornwall can offer the industrialist. For a computer company considering a move to the South-west, the balance of incentives towards the County of Avon and immediate environs government finance should never be a consideration.

Public pension funds finance creation of jobs in Midlands

TWO years of recession have seen large scale redundancies within manufacturing industries outside the development areas. And the projected upturn in the economy will do little to assist the companies now laying off staff: massive capital injections are required to refurbish obsolescent plant and replace outmoded working practices.

In the West Midlands, for example, a streamlining of the motor industry has led to a sharp increase in the number without jobs: there are districts near Birmingham where the level of unemployment exceeds that in the problem areas of Scotland.

Unlike Scotland, Wales and the North-west of England, however, the West Midlands is not classified as a Special Development Area. Under the 1979 regional aid programme it does not even qualify for Intermediate Area status, the lowest grade of assistance.

Without the lure of 22% capital grants, periods of rent free "advance factory" accommodation and ready access to investment by Brussels, the whole of the West Midlands conurbation would be at a severe disadvantage when trying to attract new enterprise to the region. The prospects for the area would certainly be bleak were it not for an initiative taken by the West Midlands County Council and the metropolitan boroughs within its boundaries.

Central to the county's strategy for the regeneration of industry in the area is an Enterprise Board, a public sector venture capital organisation that has been established by the County Council.

Set up formally in February the board has as its prime responsibility the creation of new jobs by existing West Midlands firms. The idea is to identify companies with a long-term growth potential, but which could well fail because of current economic conditions, or because they are constrained by being part of a larger and perhaps less successful group of companies.

To the extent that the West Midlands Enterprise Board is setting out to find firms in need of assistance, the project is no different from identical schemes

operational elsewhere in the UK. Where the board is breaking new ground for a provincial authority is in its approach to funding. Some £8 million of finance from county rates will be augmented by upwards of £40 million from the council's pension funds. Additional finance will be raised from private pension fund managers who can be persuaded that such an investment would be in the interest of their members.

The role of the board is analogous to that of a merchant bank investing risk capital in a commercial venture - although the long-term objective is one of generating long-term capital growth rather than the steady rise in dividends normally required by the private sector.

Relative to the appetite of West Midlands industry for new capital, the funds at the disposal of the Enterprise Board will make little impression on the region's industrial infrastructure. But even this amount, without careful control, could be used to keep afloat companies for which there is no real future.

For that reason, the approach likely to be favoured by the board will be to take an equity interest in the firms it is assisting; maintaining the vital element of public accountability to the local authority and county pension funds.

While the members of the Enterprise Board are appointed by the County Council - with elected councillors inevitably in the majority - there have been appointments from industrialists and the trades unions. As the "professional" tier of the organisation, a permanent staff of between eight and ten (headed by a former investment executive from Northern Ireland) will liaise closely with the county's new Economic Development Unit.

This unit, whose task it is to work out the details of industrial strategy, will attempt to identify particular categories and size of business which will ensure a more stable pattern of employment in the county.

Three months on from vesting day for the Enterprise Board, the concept is only now crystallising into reality. A £500,000 budget for

the period to April 1982 will grow to £3 million for the current year. The first investment decision has been taken: a loan which will convert to preference shares in the company.

An important factor is that 30 jobs will be saved by the move - one of the primary objectives of the board.

Since the proposals for the Enterprise Board were announced in autumn 1981, many applications have been received, but no action could be taken until an entity quite separate from the council had been created. With a unique form of investment involved, discussions with sources of capital have centred on the safeguards to be applied and the board's investment policy.

It is not clear at this stage whether the practice will be to spread investment over a large number of companies, or to limit the funds to a handful of firms. There would be no reason why the board could not take a majority

shareholding in an organisation, acting as the nominee for the council and the pension funds. Subject to limitations on the involvement of the board in day-to-day management, the case would be stronger for concentrating the finance in a few carefully chosen companies.

Rarely is finance the only factor restricting the growth of a business, however: professional expertise is an equally valuable commodity. The board is proposing to make available the services of experienced industrialists where this would be the most appropriate form of aid.

Allowing firms to expand at a controlled rate would ensure that the correct industrial and employment structure can be developed for the area. Current levels of unemployment are undoubtedly excessive, but little would be gained by encouraging only those firms whose future is dependent on a short-term marketing potential.

Industries in which there is a

factories are being retained as shell units for small firms. The buildings will not be divided into smaller units (from 500 to 10,000 square feet), until users have been identified. The emphasis will be on laboratory and office accommodation for high technology companies.

Computer resources will be available "on tap" to the site from the University, which will provide academic support facilities for the firms involved in the project.

For the Science Park to succeed, it must also be able to attract firms which want to build their own premises, but draw upon the University's resources. Half the present site for the centre will be cleared to allow independent development within the framework of the project.

There will be direct involvement by University staff in the companies on the site if required.

Reviving the shattered economy of the West Midlands will not be an easy task: the success of ventures like the Enterprise Board and the Science Park will not become apparent for a decade or more. But of all the regional aid schemes in the UK, these projects stand the greatest chance of success - because the driving force comes from within the community they serve.

Above all else, it is a question of self-interest.

high labour content involved in manufacturing, test and assembly offer perhaps the best hope for the West Midlands during the next decade. Recognising the importance of a technological base to the regeneration programme, Birmingham City Council is pioneering a Science Park in partnership with the University of Aston.

The project is centred on a 3½-acre site purchased by the City Council adjacent to the University. On half of the site, the existing

Starting out alone? Just started a company? Need money?

Getting the right sort of financing for your own company is crucial. Without it a computer supplier, distributor or software house could be a potential world-beater but still flop.

Computer Weekly and Barclays Bank have teamed up to organise a one day conference which will explain how computer industry entrepreneurs can raise money for themselves and their companies.

Speakers will include senior figures from Barclays, from finance institutions and from computer companies which have already been through the experience of raising cash and succeeded. Return the coupon below to book your place and learn from them.

Scots recovery hopes

From page 17

Much of the skill in electronics that Wilkins hopes to draw upon is the product of earlier redundancies in electrical engineering. Employment is being taken up in the "professional" sector of electronics and computing (opto-electronics and microwave technology, for example), in contrast with Wales where the emphasis has been on the consumer end of the market.

For overseas companies moving to Scotland, the pool of trained labour is attractive: where such a firm brings its own staff, this is usually only for specialist assignments on short-term postings. UK companies will attempt to relocate their own staff wherever possible, but may face opposition from the workforce.

Once settled in Scotland, however, families enjoy being there, according to Wilkins.

Important though staff resources are to a company, accommodation of a suitable standard is a prerequisite for expansion. Both the SDA and the New Towns Development Corporation (Scotland has five designated towns) are involved in providing a range of factory types. At the most basic level, there are standardised "advance" factories which can be adapted to a company's specific needs.

Custom building may be necessary, as in the case of the DEC site at Ayr, where the factory was built

to the company's specifications. In this essential area of accommodation, Britain is at a disadvantage relative to its competitors: the elaborate planning procedures involved in a major project may impose unacceptable delays.

As "estate agent" for the SDA, Locate in Scotland is in a position to offer sites throughout Central Scotland. The New Towns can provide comparable land for building within their own territory. When taken up by a company, these sites are often "advanced serviced" with roads, drains and main power services already installed.

By incorporating a higher percentage of office space in its new factory building programmes, the Agency is fine-tuning the structure of the business it attracts.

Wilkins identified the targets. "In terms of the thrust of development, the integrated circuit will remain crucial to the Scottish economy, but we are broadening out into sub-components and supplies. In Glenrothes, for example, we have a company making masks for the semiconductor industry."

Wilkins illustrated how computers are finding specialised applications in Scotland. "Banking and funds transfer has proved a growth area, with companies such as Fortronics, Burroughs and NCR."

"Scottish Banks have progressed further in this direction than their English counterparts," he added.

PRACTICAL COMPUTING and YOUR COMPUTER present

THE Northern Computer Fair

Personal computers
Home computing
Small business systems

When the first Computer Fair was held in London in April this year, 38,500 people crammed into Earls Court to see the latest advances in small business and home computers.

Now the sponsors, Practical Computing and Your Computer, are running a similar event in Manchester.

Local computer clubs, software houses and the manufacturers and distributors of personal computers will have the opportunity to meet with the growing number of business users and enthusiasts in the North.

TEXACO

Knightsbridge Green
London SW1

To succeed in the oil business you need to recognise the benefits of advanced technology. TEXACO uses powerful configurations of computer hardware and software in the world-wide discovery, production, refining and distribution of the most important natural product of our time. New methods of automation are continually being sought. The London installation comprises IBM 4341s running under DOS/VSE, CICS and DL/I with one machine having VM/CMS. In addition, the department has access via TSO and IMS to an IBM 3033 under MVS in Germany and extensive use is made of database, on-line and networking software.

The plans are to replace the 4300s with a new generation IBM 3080 series machine and transfer all systems to MVS/IMS.

Word-processing equipment is Philips 5002/3 and Data General Eclipse minis are in use for interactive scientific and technical applications. A CASE MSX II message switch processes telex messages around the world. An IBM 3750 computerised telephone exchange is installed in London and two Plessey PDX exchanges are in other locations.

myriad

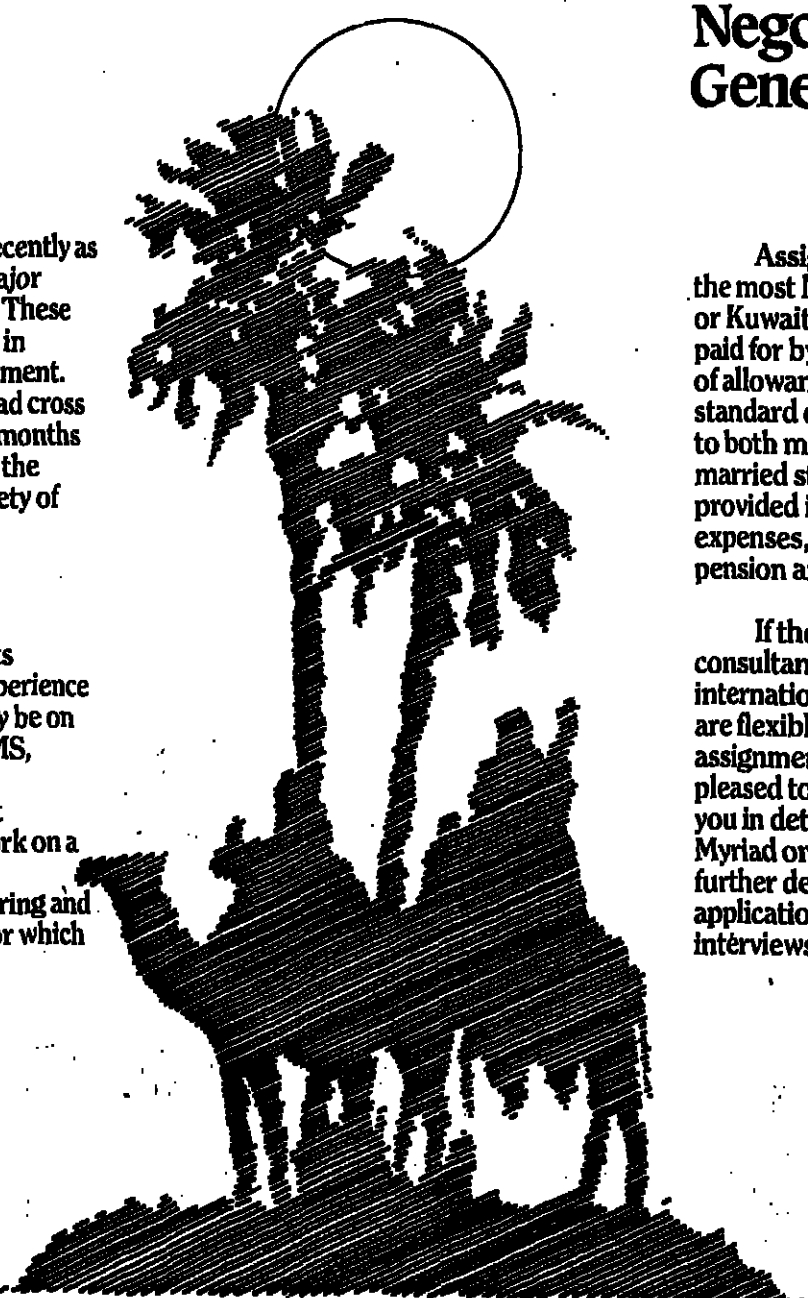

Programmers.

● Overseas Opportunities

Reading Base

These new positions have arisen recently as the result of expansion plans within a major British computer systems organisation. These are permanent positions with a UK base in Reading and offering full career development. They also offer the interest of a very broad cross section of projects, varying between six months and two years in duration and providing the experience of working overseas in a variety of locations.

The positions available are for Programmers and Programmer/Analysts offering between one and three years experience of COBOL development. This will ideally be on ICL 2900 systems and experience of IDMS, TPMS and VME/B will, of course, be advantageous although it is certainly not essential. The persons appointed will work on a variety of interesting systems including Inventory Control, Sales and Manufacturing and will use on-line and data-base facilities for which appropriate training will be provided.

● 1-3 Years COBOL

Negotiable Salaries Plus Generous Allowances

Assignments exist world-wide. However, the most likely initial locations will be in the UAE or Kuwait. Whilst overseas accommodation is paid for by the company and a generous package of allowances is provided which ensures a high standard of living. These positions are available to both men and women and on either single or married status. A full range of benefits is provided in the UK including relocation expenses, where applicable, and the usual pension and annual leave.

If the idea of joining a professional consultancy unit with the backing of a major international company appeals to you, and you are flexible enough to work on a range of assignments in varying locations we shall be pleased to discuss the opportunities available to you in detail. In the first instance telephone Myriad on Reading (0734) 585802 or write for further details to the address below. Your application will be handled promptly and initial interviews can be held in a variety of locations.

Myriad Appointments Limited

30 Fleet Street, London EC4Y 1AA Telephone: 01-353 0981 24 hours
50a London Street, Reading, Berkshire RG1 4SQ Telephone: Reading (0734) 585802 24 hours

COBOL PROGRAMMERS
to £9,500

COBOL Programmers are needed at varying levels of seniority with a minimum requirement of two years IBM experience on either OS or DOS systems. Knowledge of structured programming techniques, IMS databases or CICS would be a distinct advantage. Successful candidates will join one of several major new projects under development and they will also assist in the support of production systems. After a period of familiarisation, the senior positions also offer responsibility of leading a small programming team.

ANALYSTS
SENIOR ANALYSTS
to £13,000

With a high level of user contact, these outstanding career opportunities are available for people with four to six years previous computing experience, a solid COBOL programming background and who have moved into an analysis and design role. The persons appointed will be responsible for all aspects of major project development from specification to implementation. Previous experience of IMS and/or CICS would be a distinct advantage.

All employees are covered by a benefits package commensurate with other major oil companies (contributory pension scheme, 35 hour week, £1.85 per day LVs, etc) and their offices are located close to Knightsbridge underground station and to Hyde Park.

For further information and to arrange an early interview, please contact our consultants, Myriad Appointments, at their London office (01-353 0981).

Myriad Appointments Limited

30 Fleet Street, London EC4Y 1AA Telephone: 01-353 0981 24 hours
50a London Street, Reading, Berkshire RG1 4SQ Telephone: Reading (0734) 585802 24 hours

to £13,000

The successful applicants will join a team of systems programmers supporting the existing software which includes DOS/VSE, VM/CMS, CICS, DL/I, SNA, VTAM, RAMIS II, etc., and evaluating/implementing new packages for the U.K. and six other European countries. Candidates should therefore be prepared for some foreign travel.

When the IBM 3080 arrives, all systems will be converted to MVS and therefore full training will be provided in the intervening period, making this an ideal opportunity for DOS Systems Programmers to expand their skills. The U.K. use of the machine in Germany is currently supported by the technical group in London.

TEXACO
to £14,000

Texaco wishes to appoint two people with experience in designing and implementing database systems and at least one must have a sound technical knowledge of either IMS or CICS/DLI. They will operate in a small team and their main activities will be:

- development and introduction of standards
- database design and implementation
- assuring security and integrity
- application development support
- performance monitoring and tuning
- education in database techniques and data dictionary

**Guardian
Royal Exchange
Assurance**

LYTHAM ST. ANNES

Set in pleasant surroundings in a modern office block, the computer centre is the hub of all the company's Data Processing operations. One of the country's leading insurance groups, we are involved in a wide spectrum of advanced project development and offer job security together with first class working conditions, facilities and prospects. Our present equipment includes an IBM 3032 and an AS8000 with which we use IMS/VS extensively, running under MVS. We also have an increasing number of IBM 8100 machines. There is a major commitment to expanding our distributed processing systems using the latest techniques available.

Application Programmers and Junior Application Programmers

to £8477+ attractive benefits

To join existing project teams developing a wide variety of mainframe and minicomputer systems. Only programmers with a minimum of 15 months' practical experience need apply. The major language used for application development is PL/I, though other languages are used in our work on the IBM 8100 series. We are prepared to re-train successful candidates using comprehensive training facilities including the latest multi-media techniques. Programs are developed using modular and structured programming techniques and TSO/SPE.

Benefits include: Mortgage facilities at low interest rates and relocation expenses (in approved cases) • Flexible working hours • Paid overtime • Security of permanent employment in a long term career with good promotion prospects • Non-contributory pension, widow's pension and life assurance schemes • Excellent sports and social facilities • Easy access to the Lake District, North Wales and Yorkshire Dales.

Systems Analysts

to £10713+ attractive benefits

To join project teams developing a wide variety of applications using the latest techniques including database and teleprocessing. The ability to deal with users on the one hand and experienced programmers on the other means that the successful candidates will enjoy a high level of involvement and will need to display a professional approach in a professional environment with at least two years' proven practical experience.

Being a large installation heavily involved with database operations and currently developing large scale distributed processing networks, we offer many opportunities for career advancement in programming, system analysis or software specialisation. Progress is reviewed regularly and promotion to senior grades is based solely on merit. Salary scales exceed £12,000 for the more senior analysis and programming personnel.

Are you interested? If so ring me (reverse charges) between 5 p.m. and 8 p.m. Monday to Friday (till Friday 11th June) or write giving career details to:
Ian A. Lucy, Data Processing Department

Systems Engineer

Our Client, an International Company, with a plant located in South Wales, has a vacancy for Systems Engineer to work on a positive and aggressive Manufacturing Systems plan including applications such as Process Management and Laboratory Information Systems.

The successful candidate will hold a degree in Engineering or Computer Science and have at least 2-3 years experience on Hewlett-Packard 1000 series computers, using Fortran, RTE1VB and IMAGE Database, or similar hardware/software exposure.

He/she will be responsible for evaluation, design and implementation of equipment, software and instrumentation relating to computer monitoring control and data acquisition.

The ability to think logically and clearly present information both in writing and by means of formal presentations is essential.

The Company offers a competitive salary, linked to an incremental based plan, together with a non-contributory pension and life insurance scheme. Generous relocation expenses are available, where appropriate.

Please write giving full details of experience to: Slobhan Holland, Riley Advertising (Southern) Limited, Europa House, Queens Road, Bristol BS8 1AG. Please list separately any companies to whom you do not wish your application to be sent.

A member of the Rex Stewart Group.

REAL TIME SOFTWARE FOR PROCESS CONTROL SOFTWARE ENGINEERS

An expanding sub-division of an International Professional Company specialising in Process Control for Power Station Computer Systems and Energy Management Control Systems seek additional engineers for permanent career in Software Development.

Based in Switzerland, successful candidates will be required to take full responsibility for all stages of development from design through to implementation in these English speaking projects.

Broadly speaking, we are looking for candidates to concentrate on establishing new Standard Software and who will more than likely have worked with or have an interest in most of the following: Modern Real Time Software, Computer Networks, Man Machine Communications, Multi CPUs Systems.

Candidates should have a high academic background and experience of most of the following: Real Time Software, Process Control, ASSEMBLER, PASCAL, FORTRAN, PDP11, RSX11 and VAX 780s. Some candidates may be called upon to travel worldwide for short term commissioning purposes.

Successful candidates may look forward to enhancing their career prospects, gaining valuable experience in an international environment.

Interviews will take place in London or the Continent in early July. For immediate consideration, please send a copy of your CV or telephone for further details and/or an application form.

computing centre manager

We are searching for a Computing Centre Manager for a new, recently established research facility of Schlumberger Drilling and Production Services. The new research division, Schlumberger Cambridge Research, has been formed to inject high level scientific research into areas which are still largely viewed as an art. Schlumberger Cambridge Research, therefore, consists of a very high level team of Research Scientists who are carrying out advanced experimental, analytical and numerical investigations.

The Computing Centre Manager will be responsible for setting up a new Computer Centre which will be the core of the new facility. The initial task will be to supervise the installation of a VAX11-780. Other tasks will include co-ordination with other computing centres in the group to ensure, in particular, software compatibility; recommend hardware and software extensions to meet growing

needs, (word processing and electronic filing, graphics, CAD, computer to computer communications, data acquisition and control). The Manager will also be expected to promote Computer technology in a world of scientists.

Candidates must have previous experience with VAX11-780, be a good organiser and communicator as well as having a wide knowledge of hardware.

The company has a very positive attitude towards remuneration, therefore, the salary will reflect the importance attached to this role. This appointment is based in Cambridge.

To apply, in the first instance, either send a curriculum vitae or phone for an application form quoting reference CCM. Please address your reply to Geoffrey King, Managing Director of Cambridge recruitment, who is advising the company on this appointment. The position is open to both men and women.

CHIEF PROGRAMMER

NW LONDON To £12,500
Due to a major expansion programme, and installation of IBM System 34's in each of its factory locations this leading company in the electrical industry is looking for a Chief Programmer. Substantial RPG II experience and familiarity with IBM SYSTEM/34 software and utilities are required; also a knowledge of Cobol would be advantageous. The role involves providing technical advice where necessary, and responsibility for the maintenance of all software. Ref: S3878

ANALYSTS & PROGRAMMERS

SURREY £8,000-£10,000+MORTGAGE
A Nationally renowned Insurance company is looking for further Systems Analysts and Programmers to enhance its development teams, using large ICL 2900 machines. Ideally the Systems Analyst should have 2 to 3 years experience, with exposure to Database Systems, good experience of systems design in Financial or Management Information Systems and a COBOL background. The Programmer requirement is for persons with a minimum of 2 years ICL COBOL experience utilized within a VME or DME environment, working with financial applications. Salaries are negotiable and relative to experience and all positions attract a generous benefits package which includes MORTGAGE SUBSIDY. Ref: C3585

ANALYSTS

CITY To £11,000+MORTGAGE
Our clients, a leading city-based Insurance Group, is seeking two further Systems Analysts to play major roles in their imminent Development projects. They require two people with a good ICL Cobol background capped by at least 1 or 2 years formal analysis work. Experience in financial or commercial applications is desirable and some Insurance exposure would be particularly welcome. Our client would be very interested in talking to persons who match these requirements and in exceptional circumstances an even more generous salary and benefits package could be offered. Ref: C3695

ANALYST/PROGRAMMER

CITY To £11,000+MORTGAGE
Expansion of a major international Bank's EDP team affords an exciting opportunity for Analyst/Programmers with 2-3 years experience in banking, financial or commercial applications. The work involves implementation and development of systems, both in the UK and abroad on PDP11 and VAX machines, therefore a background which includes Basic, Cobol or a similar type language working with large MINI computers is desirable. Ref: C3914

PROGRAMMERS

SURREY £7,000-£10,000+MORTGAGE
Our client is a well established financial institution based in Surrey. Due to major development work now being undertaken they wish to recruit bright young PL/1 programmers to their team. The position would be ideal for candidates with 1-2 years experience, perhaps seeking their first change as there are excellent chances of promotion coupled with a benefits package which includes MORTGAGE facilities. Ref: R3877

PROGRAMMER

LONDON c.£9,000+MORTGAGE
Around 2 years IBM Cobol may give you an opportunity with a leading European bank to be trained in CICS and DL/1. Whilst exposure to this or similar software in a banking or financial environment would be useful, the main criteria are considered to be personality and attitude. An excellent range of banking benefits, including MORTGAGE is offered. Ref: R3943

JUNIOR ANALYST

CITY £9,000-£10,000+MORTGAGE
A major British bank have an opening which could provide the first step into a full Analyst role. Some analysis experience is required probably gained in an IBM environment as an Analyst/Programmer. The company have some exciting development plans which together with a significant hardware upgrade offers a challenging and rewarding opportunity. All the usual banking benefits, including MORTGAGE are available. Ref: R3733

ANALYST/PROGRAMMER

CITY c.£10,000
An Analyst/Programmer is required by a leading city based bureau, dealing mainly with financial/banking applications. They are looking for confidence, ambition and an IBM GSD background, utilising RPG II and III. Good potential for progression to S38 and into Systems Analysis is offered for the selected candidate. So, if you have 2-3 years RPG experience and would like to be involved in the development of bureau applications in a progressive company, please contact us immediately. Ref: S3947

ANALYST/PROGRAMMERS

N LONDON c.£9,000
A leading engineering company are looking for 2 Analyst/Programmers with an IBM SYSTEM 34 or 38 background. An experienced RPG II or III programmer who would like to move towards Systems Analysis, would be ideal. Excellent promotional prospects are offered, and a package including annual bonus and non-contributory pension is available. Ref: S3933

PROGRAMMER/ANALYST

CITY c.£9,000
This BANK in Central London is looking for a Programmer/Analyst with approximately 18 months to 3 years experience in an IBM GSD environment utilising RPG II and III. The selected candidate will be required to work abroad for 10-12 weeks of the year and will receive an attractive "Banking" package, which includes a generous mortgage subsidy. A high standard of education (preferably degree) is required, and experience of banking applications advantageous. Ref: S3924

24-hour Ansaphone

01-283 9941

Britannia Building Society

We operate an ICL 2272 running VME/B. We have over 300 branches, half of which are equipped with terminals on-line to the mainframe at Leek. We plan to extend this system to all branches and to re-appraise all our applications software.

SYSTEMS ANALYST

up to £10,185 plus benefits
The Computer Systems Department is responsible for the analysis, design, testing, implementation and maintenance of all mainframe systems.

The person appointed will be in a small team of analysts under a project leader and will be expected to be able to work both as a member of a team sharing large projects and independently on small projects.

Candidates must be able to demonstrate that they have seen projects through all the stages above and are able to communicate effectively with all levels of staff both verbally and in writing. Experience of VME/B is an advantage but is not essential.

In addition to the annual salary there is an attractive package of fringe benefits. Application forms are available from Mr. Roy G. Hewson, Assistant General Manager (Personnel and Administration), Britannia Building Society, P.O. Box 20, Newton House, Leek, Staffs., ST13 5NQ, or telephone Leek (0538) 355131, Ext. 15.

TECHNICAL SUPPORT PROGRAMMER

up to £8,745 plus benefits
Technical Support is responsible for the VME/B base and associated software. It is also responsible for TP and for the performance of BATCH and MAC work.

The site is currently running on 6.14 and the immediate future will see the move to Release 7. Implementation of New York Management and the addition of FDS840s prior to the expansion of the TP system.

The person appointed will join a team of 4 people. Applicants should have experience of VME/B and a knowledge of TPMS. Performance monitoring on new work would be an advantage.

MANAGING DIRECTOR

BDS, a leading supplier of computer peripherals specialising in printer systems, have a vacancy for a Managing Director of Corporate Operations to accelerate growth within the U.K. and Western Europe.

The candidate must be able to demonstrate a successful marketing background with total responsibility for full financial control.

Excellent salary and usual fringe benefits will apply.

Please write with c.v. to:

Personnel Manager
BDS COMPUTER (UK) LTD.
125 Highgrove Street

David Grove Associates Banking Personnel Recruitment

BANK

DEC PDP SYSTEMS PEOPLE
ARE YOU MOBILE —
INTERESTED IN BANKING?

International Bank requires Programmers and Programmer/Analysts who are willing if necessary to relocate outside London.

Candidates must have a minimum of 3 years programming experience on mini-computers, preferably DEC PDP, programming in AIMS, BASIC+ and/or COBOL. For the Programmer/Analyst positions, practical analysis and design experience is essential, and some knowledge of staff supervision gained in a financial environment.

Applicants should also be prepared to travel throughout both the United Kingdom and Overseas.

SECRETARIAL

INTERNATIONAL BANK
JUNIOR PROGRAMMER/
ANALYST

c. £9,000

Prestigious City-based Bank seeks a Programmer/Analyst aged approximately 25 and with previous NCR & COBOL programming experience. Ideally the candidate will have gained his knowledge of Data Processing in banking, or financial applications.

For this post the candidate will need to be a conscientious and enthusiastic worker.

We have many more Data Processing vacancies both at senior and junior level, therefore, for more information about the above appointments and others, please contact BEVERLY COLLINS ON 01-236 7961.

SOFTWARE PROJECT LEADER

c £10,500 p.a.

SOFTWARE ENGINEERS

c £9,000 p.a.

Westinghouse Signals, a member of the Hawker Siddeley Group, is responsible for the complete design, manufacture, installation and commissioning of Railway Signalling Control Systems in the UK and overseas. As part of the Company development we are now looking for the following:

Software Project Leader

Required for our Software Development Department. All software being developed is for real-time control systems based on a variety of micros and minis. This includes the most exacting field of safety systems.

The ideal candidate will be educated to degree level and will have a sound background using high and low level languages for real-time applications. Experience of project

control, estimation and the production of specification and documentation to a high standard is considered important.

Software Engineers

Qualified Engineers with experience of software for A.T.E. are required for development of both hardware and software for a range of computer based test equipments, including printed circuit card testing.

Applicants should have at least 2 years relevant experience. Familiarity with HPL and BTL as used on the HP3080 could be advantageous.

Successful candidates (male or female) will be offered salaries negotiable around the stated figures and an attractive relocation package where appropriate.

Interested applicants should write giving full career details to: Miss F. T. Cox, Personnel Officer, Westinghouse Signals, PO Box 79, Foundry Lane, Chipperton, Wilt. Telephone (0249) 4141, extension 700.

LAN Support & Development

Thames Valley: Salaries to £12K

Communications Software Analysts and Designers, who have been primarily involved in Research and Development but are now seeking more customer contact, are urgently required by our clients. Candidates should have been employed in a mini- or micro-based distributed processing environment for at least two years with the role of having encompassed Systems Design and Programming. Software skills should include fluency

in an Assembler and a high-level, block structured language. There will be initial product training at the Company's U.K. headquarters where successful applicants will become familiar with both the design concepts and the applications area of a broadband-based LAN. Subsequently the majority of time will be spent assisting clients in the tailoring of the system to particular applications areas. Ref: L/22/A

Navigation Systems

Inner London & Home Counties: Salary to £12K

A highly regarded supplier of precision instruments and electronic devices is seeking several Software Development Engineers for either its Central London support facility or its Thames Valley-based Research & Development Laboratory. Suitable applicants must be numerate graduates who are currently involved in the design and development of microprocessor-based control systems. Practical programming skills must

include total fluency in one or more of: Pascal, Fortran or Macro 11. Candidates should have the ability to resolve complex software problems for end users demanding total reliability or where operating conditions are not necessarily conducive to high technology products. For certain positions you should have project team leadership aspirations which will reflect in the salary offered. Ref: L/22/B

Real-Time Computing

Netherlands: Salaries to £15K

On behalf of an expanding Systems Supplier and Consultancy, we are seeking a number of Software Programmers and Applications Engineers for permanent career positions in the Netherlands. Candidates should hold a numerate degree and have at least one year's post-university experience. Software programming expertise should include fluency in a high level language such as RTL 2, PASCAL or ADA with preferably a working

knowledge of an Assembler language as a subsidiary skill. Of particular interest will be those who have participated in the development of a PDP or VAX based real-time system or, alternatively have utilised a 32-bit mini-computer as a software development tool. Ref: L/22/C

Pascal Programmers

N. Home Counties: Salaries to £10K

The Research and Development division of a leading multinational corporation requires a number of Programmers to assist in the development of both Applications and Systems Software. All respondents should possess a degree or H.N.C. in a relevant discipline followed by at least two years in industry. A minimum of one year's development experience on either Intel 8085 or Z80 based systems, preferably running under CP/M or UNIX is essential as is fluency in Pascal. A knowledge of protocols and techniques and an Assembler language are useful supplementary skills and will attract a salary premium. Ref: L/22/D

C + UNIX Designers

Greater London: Salaries to £11K

An internationally recognised supplier of Hardware and Software Systems plans to introduce a new product line based around the 'C' programming language and running under UNIX. Suitable respondents should hold a numerate degree and be fluent in an Assembler language and at least one high level language, preferably C or Pascal. Of

additional interest will be those who have current involvement in a systems development role on any leading 8- or 16-bit microprocessor. Whilst the majority of development work is obviously conducted in-house, a degree of mobility is essential for client visits during implementation and subsequent sales support. Ref: L/22/E

Assembler Programmers

Essex: Pkg to £12K + Relocation

A leading British financial institution with offices in rural Essex is currently seeking additional Assembler Programmers for its recently installed distributed processing system. Applicants should offer a minimum of 18 months' Assembler programming experience preferably gained in a financially orientated real-time mini-computer or mainframe environment. Particular hardware is not important, as the client offers excellent in-house training. However,

for the more senior position of Lead Programmer, applicants must offer some knowledge of IBM mainframes, TP systems, IMS and/or structured programming techniques. These positions represent outstanding career opportunities and if you demonstrate potential, you will be able to progress rapidly into either systems analysis or management. There is an excellent relocation package for applicants not resident in the Essex area. Ref: L/22/F

Micro Design Engineers

Thames Valley: Salaries to £10K

A number of Microprocessor Design and Development Engineers are sought by a leading microcomputer and semi-conductor manufacturer. As there are a considerable number of positions available, the variety of skills required is, necessarily, diverse. However experience in one or more of the following areas is essential: customisation of Operating Systems such as CP/M or MP/M, with a salary premium attached to

knowledge of a networking O.S.; compiler and cross-compiler development particularly if utilising PASCAL or C; familiarity with a leading MDS and, also, experience in the design and production of interface hardware and software. A degree of customer contact is a feature of most of these positions and, therefore, an outgoing personality and good communications skills are required. Ref: L/22/G

Product Marketing

Central London: Salary to £17K + Car

A leading supplier of Hardware and Software Systems has an immediate requirement for several Product Marketing Engineers and Consultants for its Central London headquarters. Candidates, aged 28-35 years, should have recent and very recent experience in a similar role preferably within a supplier of Commodity, Banking or Insurance orientated systems. Preference will be given to candidates who have experience

of the majority of the following work areas: marketing studies, product appraisal and planning, mailing and canvas, "shows", seminar presentation, product demonstration, public relations and lecturing to customers' staff. Whilst generally you will be working at our client's premises, these positions will entail a degree of national travel. Ref: L/22/H

New York Banking

Manufacturers Hanover Trust Company

is the fourth largest American bank, with headquarters in New York and facilities in 40 countries world-wide. The company is at the forefront of the movement from traditional banking methodology to newer, more sophisticated techniques. We operate a structured career development policy, fulfilling all relevant training needs, so that progression may be via both technical and managerial paths. We now wish to expand our DP department by offering permanent positions to DP professionals from the UK which, in addition to the starting salaries indicated, carry substantial banking benefits.

As the environment is primarily IBM, we are particularly interested in hearing from those with experience of: ★ On-line OS or DOS COBOL and ASSEMBLER languages ★ IMS or CICS and DL/I.

In London we have a department whose sole responsibility is to recruit for the New York office, answer any questions you may have, process all visa applications, assist with relocation and generally help and advise. Brief descriptions of some of the positions available are given below.

Senior Systems Analysts
to c.\$35,400

We are looking for the full range of analytical and design skills, ideally coupled with a programming background.

Systems Analysts
to c.\$28,800

Previous experience as a programmer is required, plus familiarity with the techniques of systems analysis, systems design, file design and data access techniques.

Senior Programmer/Analysts
to c.\$35,400

The main responsibility will be the provision of technical guidance for programmers and projects, including scheduling and co-ordinating.

Programmer/Analysts
to c.\$28,800

Considerable programming experience and some systems design experience are required, so that support for complex programming projects may be given.

If you are interested in finding out if your experience matches our requirements more closely, please contact Joan Ainsworth on 01-600 5666 extension 3533 or write to her at Manufacturers Hanover Trust Company, Queensbridge House, 60 Upper Thames Street, London EC4V 3EN.

Our client is a world leader in advanced transportation technology, a global network of subsidiary and associate companies in over 30 countries. At the centre of this sophisticated organisation is one of the largest and most impressive data-processing facilities.

At its London headquarters several multi-million pound on-line, database projects are under way. These will maintain the company's dominant position into the next decade.

The company is aware of the vital importance of systems programming in its data-processing strategy and believes in developing their ability within the organisation. It is therefore committed to substantial investment in technical and related training and, in an environment where pace of design and implementation is rapid, ability is the only criterion for advancement to senior opportunities.

In order to continue to create and maintain the systems software needed to achieve major development milestones, our client would like to hire from ambitious systems programmers who are capable of exploiting their current experience in an innovative and dynamic environment.

CICS

Working closely with applications teams, the TP group will have a central role in the following developments:

- Major expansion of the network to 450 terminals
- Integration of mini computers
- Support for large real time systems running on CICS 1.5

MVS

The operating systems team will be involved in some major software upgrades. These will include:

- Implementation of MVS/SP3
- Installation of HSM in preparation for a Mass Storage System
- Software support for IBM 3380 disks

The company offers attractive salaries and the usual benefits associated with a large organisation.

If you would like to develop your career in this prestigious environment, telephone James Attawell on 01-567 5501 or clip the coupon below.

Responsible for all systems development, hard and software selection, revision of new and existing systems.

Applicants should preferably have I.C.L. backgrounds with approximately 10 years experience in similar capacities. The remuneration package includes attractive salaries plus car, bonus, medical aid, pension fund and assistance with relocation for these positions.

Interviews will be held shortly in the United Kingdom by the Group Services Manager.
For further details and application form please apply to:-
Listgrove Limited
8th Floor, Woolworth Building
102 New Street, Birmingham B2 4HO.
Telephone: 021-643 1844.

Systems Programmers

(MVS-JES3)
Join in the search for more energy
Salaries £9K-£13K

Geophysical Service International (GSI), the world's leading petroleum exploration company, is looking for Systems Programmers to be based at their new computer complex in Bedford.

You will be part of a team responsible for maintaining and supporting an MVS-JES3 operating system on a large IBM mainframe utilising the latest state-of-the-art hardware and software technology.

Initial training will include 4-6 months temporary assignment at our major data processing centres in Austin, Texas.

These are exciting career opportunities open to individuals with a minimum of 2 years' relevant system programming experience, preferably including MVS internals.

Successful candidates will be offered attractive salaries in line with experience, together with an attractive benefits package which includes relocation assistance where applicable.

Interviews will take place during late June, so call or write NOW for an application form to: Gwen Ventris, Personnel Department, Geophysical Service International, Manton Lane, Bedford MK41 7PA. Tel: Bedford (0234) 223778.

SALES OPPORTUNITY

c£19,500 per annum +

A major European
Computer Service
Organisation with a 37%
UK growth in 1981.

Our Client is a profitable, professional and fast growing leader in the computer services industry, with an envied reputation for the quality and scope of its computer service, software product range and professional staff.

A recently created Sales Division, recognised as the fastest growing sector of the company, was formed to capitalise on the rapid growth of the UK client base and business (approaching a turnover of £10M), providing the future management for planned branch offices and divisions.

The continued spectacular development of this division offers the opportunity to sell a range of products for vital management systems to both new and existing clients in well defined market areas.

This will prove most attractive to the above average sales executive, wishing to add marketing experience and team leadership to their success in sales.

Ideally, you will have a proven sales track record with a service bureau, major computer supplier or software house, and have a good understanding of the computer industry in general.

For further information and immediate confidential interview, contact Peter Dudgeon on 01 935 0671 (24 hour answering service), or 01 674 8627 (evenings and weekends).

Jnr. Macro-11 Progs.

E.E.C.: Pkg. to £12k

A number of Macro-11 Programmers, willing to relocate overseas for a minimum of 12 months, are required to join the Italian and German offices of a leading British Systems and Software House. Suitable applicants will be graduates with a minimum of 12 months' real-time programming on a PDP-11 configuration running under RSX 11M. Fluency in Macro 11 is, of course, essential, but candidates able to offer additional skills in Fortran or Pascal are particularly encouraged to apply. Applications experience should, ideally, have been gained in a data communications or process control environment. Ref. L/20/A

Pascal/Unix

South England: Salaries to £10.5k

A Systems and Software supplier, renowned as one of the U.K.'s leading high technology companies, is currently seeking PASCAL Programmers for its software development group based in Southern England. Suitable applicants will be graduates in a numerical discipline with at least one year's industrial experience in a real-time scientific environment. It is essential for all positions that you offer fluency in PASCAL preferably gained on a mini or micro-computer running under UNIX. In particular, our client will favour applicants who have had exposure to PDP-11 or VAX 11/780 machines. For the more senior positions, you should have some knowledge of Computer Aided Engineering, and, obviously, demonstrate management potential. Ref. L/20/B

RSX-11 Applications & Syst.

Hants/Surrey: Salary to £12k

On behalf of the Consultancy and Software Services Division of an E.E.C.-based company we are seeking a number of Systems Engineers and Applications Programmers. Software programming experience should include fluency in a high level language such as Pascal or Fortran, whilst some involvement with an Assembler will be considered a useful secondary programming skill. In certain cases candidates must have actively participated in the development of a distributed processing system where either PDP-11/RSX or VAX/VMS hardware and software is utilized. Additionally, the company wishes to recruit for its Research & Development Unit a number of Programmers who are familiar with M.O.D. hybrid systems where stringent programming and design specifications within a multi-microprocessor environment are employed. Ref. L/20/C

Data Communications

Central London: Salary to £13k

A renowned supplier of Hardware and Software Systems is seeking a number of Data Communications and Telecommunications Designers/Engineers for its Central London operations. Successful candidates should have at least one numerate degree and be fully familiar with recent product developments in the areas of Local/Remote Area Networks, Word Processors and Office Automation Systems. Of special interest will be those candidates who have a profound knowledge of data communications, protocols, techniques, ie X-25, HDLC/SDLC. Candidates who have had recent experience of software programming and systems design in a high level or block structured language will generally receive a salary premium. Good personal presentation skills are of paramount importance since you will be expected to liaise with both technical management and non-technical personnel. All positions will entail a degree of travel within the Home Counties areas and occasionally overseas. Ref. L/20/D

Graphics/CAD

Home Counties: Salaries to £11k

A market leader specialising in the production of computer systems for design applications is currently seeking additional Systems Programmers and Applications Support Consultants. Suitable applicants will be numerate graduates, preferably with a degree in either Mechanical or Civil Engineering. Subsequent industrial experience should include at least one year's Fortran or Assembler programming experience in either a technical or scientific environment. In particular, knowledge of Finite Element Modelling, Numerical Control or Computerised Drafting Systems would be of distinct advantage. All positions will involve a degree of national and international travel and, in certain circumstances, a company car will be provided. Ref. L/20/E

Management Consultants

Central London: Salaries to £18k + Car

A U.S.-owned international Consultancy is currently seeking additional Management Consultants for its Central London operation. Suitable applicants will be graduates who have at least five years' data processing experience and have probably progressed into a management role. You should offer a wide-ranging knowledge of hardware and business applications, but of paramount importance will be the ability to identify problems from both a business and technical point-of-view and to communicate with personnel at all levels. In particular, our client has a stated preference for applicants who have had exposure to IBM hardware and are familiar with structured design techniques, database management systems or networking. The above-average salaries offered reflect the importance of employing Consultants of a high standard to maintain the Company's excellent professional reputation. Ref. L/20/F

Comms. S/W Designers

South Wales: Salaries to £11k

A world-leading supplier of telecommunications equipment has a number of requirements for Communication Software Designers to join its Research and Development facility. All candidates must possess at least one degree in Computing Science or Electrical/Electronic Engineering and have had two years, or more, in an industrial environment. Past responsibility for hardware implementation, as well as software design of low level protocols up to, and including, Transport Service will be favoured. Applicants should, preferably, have hands-on experience with a leading MDS and be fluent in an Assembler and one or more high-level block structured languages. Ref. L/20/G

Firmware Programmers

Cambridgeshire: Salary to £10k

A hardware manufacturer and software supplier, with a rapidly expanding customer base, has a number of vacancies in its Research and Development Department. Applications are invited from those with experience in the design and production of single or multi-board computers, interface design and microcode assembler programming. All candidates must be graduates and thrive on working in a loosely structured but dedicated environment where technical expertise is highly rewarded. Ref. L/20/H

A major recruitment supplement

to coincide with a major computer show

Belle Vue
MANCHESTER
June 22-24 1982

To coincide with Compec North the June 17 issue Computer Weekly will contain a special recruitment supplement. Editorial will cover the computer market in the Midlands, North of England and Scotland. Topics covered will be relevant and written by experts and staff writers covering a wide range of subjects linked to the job market in these areas. The issue will be distributed in the normal way to all Computer Weekly readers throughout the U.K. and will also be available to visitors from the Computer Weekly stand at Compec North.

This issue is perfect for recruitment advertisers -- the editorial environment is right, the target audience is captive, and as Computer Weekly has a total circulation of over 100,000 copies every week, advertisers can be sure their advertisements will be read.

To be sure of your space reservation, phone nearest Computer Weekly classified office today.

SHIFT MANAGER

Cambs/Lincs Borders

c-£11,000

This well established yet still expanding IBM installation provides a complete service to users throughout this progressive and successful company. As a result of a re-organisation within the operations function there is a vacancy for an additional Shift Manager.

Emphasis is given to providing a high service level to users, running a 24 hour shift 6 days each week and this will include the provision of an on-line telecommunications based system to remote users throughout all shifts.

Candidates for this responsible position must have had extensive computer operations experience including some significant supervisory experience in IBM mainframe installations. Preferably this should have been gained in a DOS environment as our client operates a dual 4341 installation under DOS/VSE. Knowledge of JCL and utilities and other major IBM software including VM and CICS would be useful.

Previous experience should also include operating in an installation with a major on-line TP facility with a demand from users for high service levels on that system.

Salary will be negotiated in accordance with the indicator shown and will reflect the ability of the successful candidate and also the senior level of this position. Relocation expenses and an interest free bridging loan are available in appropriate cases.

ANALYSTS & PROGRAMMERS

Cambridgeshire

Our client has a successful IBM mainframe installation and developments include TP based systems and an increasing use of distributed processing.

Applications are invited for the following vacancies:

ANALYSTS £8,000 to £9,500

Candidates should have a minimum of 1 years systems analysis experience, together with a sound programming background. Appropriate remuneration will be agreed with the successful candidates which will reflect both their experience to date and also their potential for the future. (CW/8220)

PROGRAMMERS £7,000 to £9,000

Candidates should have from 2 years experience programming in PL/1 or COBOL working on a range of commercial applications. Training will be given to candidates in PL/1 or COBOL as appropriate. (CW/8221)

General conditions and prospects for career development are first class and where appropriate a generous relocation package would be available.

Business Analysts-

Do you know which way you are going?

SALARY TO £11,000 PLUS MORTGAGE

You are a young, up-and-coming Analyst, currently working in Insurance or in a finance related field.

You are now considering an important career move, and are determined to make sure that you are going in the right direction.

Would the right direction be to join an internationally regarded insurance company which is totally committed to a significant five year growth plan, where you would join a new, young and highly motivated Business Systems Group? Would providing the best business systems for both existing and potential users motivate you? And would you enjoy the technical challenge of interfacing with the computer applications specialists when the best solution is computer-related?

If the answer to the above is 'yes', then you are already thinking about ManuLife.

What ManuLife will look for in return is a successful record in Business Systems, Computer Systems, or O & M, spanning at least eighteen months. In addition, you would also be expected to have a logical approach to problem solving, and respond well to fresh challenges as they confront you.

ManuLife's modern offices are in Stevenage, Hertfordshire, a town surrounded by beautiful countryside. The company offer generous relocation assistance where appropriate.

Benefits are good, including subsidised mortgage facilities, free restaurant and flexitime.

For full details, and application form, please telephone 01 439 8591, or alternatively return the coupon below.

Initial interviews can be conducted up to 8.00pm each evening, or on Saturday mornings, by appointment.

PROJECT ASSISTANT

(Ref. 312/82) £10,941-£11,823

ANALYST/PROGRAMMER

(Ref. 313/82) £7,620-£10,596

Both posts form part of a team under a project leader and are of senior status. Applicants should be experienced systems designers with COBOL programming background and be thoroughly conversant with batch and communications work. Equipment includes an ICL 2960 being supplemented by ICL 2848. All running under D.M.E.

Salary placing in accordance with experience. Assistance with removal and legal expenses in appropriate cases.

Applications, in writing, giving full details of relevant qualifications, experience, age, present salary and employment, together with names of two referees, should be lodged with Director of Manpower Services, Woodhill House, Aberdeen, AB9 2LU.

University of London
Computer Centre

London Network Team

Applications are invited for a new post in the University of London Network Team. The Team is responsible for the planning and implementation of Data Telecommunications Development throughout the University and operates from the University Computer Centre.

University communications are in the process of conversion to X25-based packet switching. The requirement is one of the largest of its kind based on a single Computer Centre. Other relevant aspects are the development of appropriate local area networking with and between colleges, and the planning of new services to operate over the entire network.

The post will involve a good knowledge of traffic analysis and prediction, the assessment and planning of the conversion of host systems attaching to the network, and involvement in the development of national working groups.

Applicants should have a good degree in Science or Engineering. Experience in systems programming and/or the development of communications systems would be very advantageous.

Salary commensurate with age, relevant qualifications and experience will be in the range £8,070 to £12,860 (both under review) plus £1,035 London Allowance.

The appointment will be for a fixed term terminating in September 1985.

Application forms are available from: N. Savage, University of London Computer Centre, 20 Gullford Street, London WC1N 1DZ. Tel. No. 01-406 8400 Ext 341.

Applications close three weeks after publication of advertisement.

SOFTWARE
ENGINEERS

New product development in Scotland

Just see what the future holds for you at NCR—the world's largest computer company and the leading supplier of Self Service Financial Terminals to banks and financial institutions both in the UK and worldwide.

Five major new products under development in an expanding engineering group have created a number of job opportunities for systems software specialists to develop and implement advanced processor terminal systems and mini-computer applications. You join one of our project teams developing:

- terminal control operating software
- micro processor controlled devices
- communications network software
- system generation, distribution & debug utilities

That's what we expect from you; here's what we've got to offer:

- * Opportunities at senior level and all the way down to fairly recent graduates.
- * An organised structure of career development that gives advancement to talented individuals.
- * Salaries and benefits that are amongst the most competitive in business, including a generous relocation package.
- * A healthy lifestyle for you and your family—golf, walking, skiing and all other social amenities close at hand.
- * Good quality, reasonably priced housing available in many different locations—and no traffic jams on the way to or from work.

If that's what your appetite and you'd like to know more about NCR and Tayside (on the beautiful East Coast of Scotland) have then phone or write to:

**Ian Hume, Manager—Employee Relations,
NCR (Manufacturing) Ltd., Kingsway West,
Dundee, Scotland.
Tel: Dundee (0382) 60151.**

It could be the first step to a new and more rewarding life.

Systems Analyst

Salary Range £7,850 to £10,000
(Ref: B.732)

Bromley has replaced its ICL 1903T computer with a 6MB 286 machine running under CME/GIII and VME 2900 and requires a Systems Analyst to work as a member of a project team responsible for all aspects of system development. The analyst liaises directly with user departments and is responsible for defining their requirements and the design, implementation and maintenance of systems.

At least two years' experience as an analyst is required. Experience of structured programming, database, T.P., and implementation of packages would be an advantage.

The successful applicant will receive a starting salary within the above salary range commensurate with experience and the career structure of the installation. Additional benefits include flexible working hours, excellent leave conditions, interest free season ticket loans, canteen and social club facilities.

LOCATION—Close to Bromley Town Centre with its excellent shopping facilities and easy access by fast trains to both Central London and the Kent countryside.

Further information from Computer Development Manager,
Tel: 01-464 3333, Ext. 3265. Closing date June 17th, 1982.

Application forms from the Assistant Chief Executive (Head of Manpower Services), Bromley Civic Centre, Rochester Avenue, Bromley, Kent. Tel: 01-464 3333, Ext. 3326 quoting reference.

SMR
Sales & Marketing Recruiters Ltd

A Sales and Marketing Services Company

Senior
Sales and Marketing
Executive
U.K. and Europe

Our client is one of the world's most successful and fast expanding suppliers of mathematical and statistical sub-routines, finite element and other technical software with installations in 18 European countries and in many other overseas locations including India, Australia, New Zealand, Canada and the USA. Its user base includes a vast number of scientific and engineering establishments involving working systems on over 30 different computer types. Product development is based on close collaboration with around 200 specialist technicians world-wide.

Continuing success has created the need for an experienced sales executive to take total responsibility for the company's direct sales and marketing activity throughout the UK and Europe. Candidates are likely to be currently involved in technical sales within a services environment, preferably graduates in a numerate discipline with experience of using computers for the solution of technical problems. Only experienced sales people will be considered; and whilst the ability to speak French or German would be advantageous, and qualities such as self-motivation, resourcefulness, persistence and efficient organisation are assumed, the ability to work without supervision, and handle all marketing responsibilities is essential, as is the potential for advancement into management.

The job is based in

The Home Counties

and includes a comprehensive remuneration package which contains substantial minimum income guarantees and on target earnings of

£18,000 + Company Car

Further information on this 'ground floor' opportunity can be obtained from Peter Hubble or Alasdair Scott by quoting reference HSA/052.

SALES BIT

Quality of Management—12

Failure to train
salesmen costs
industry dearly

OUR associates, Advance Marketing Management, are always kept busy providing sales and management training to a broad selection of computer companies. Participants undoubtedly gain considerable benefits from these courses which cover a wide variety of subjects from basic selling techniques to the sober realities of finance.

Yet when I observe the computer industry at large I am astounded by how few organisations have any real commitment to sales training. Of those which make such an investment, many do so in an impulsive and haphazard manner.

'We've got a new salesman starting next week. We'd better tee-up a course for him somewhere!'

'Fred Jones seems to be having trouble getting appointments. Maybe we should send him to a course on telephone techniques!'

'The ABC sales training company say they are running a course on letter writing. Who can we send?'

Relative to the number of computer companies in operation only a small number have any formal plan for training, and even fewer have the appropriate financial approval within their sales budget. Yet even at this level I am only talking about training for established salespeople—refresher courses, product training, and so on.

When it gets down to totally comprehensive training of inexperienced salespeople there are probably no more than four companies within the industry which have both the capability and commitment to be able to take in new recruits and turn out thoroughly trained professional sales people.

From my day-to-day exposure within the recruitment courses:

■ **WORTHING**, Sussex, is the venue for the courses offered by MSS in June and July. They include Word Processing in the Modern Office, June 24-25; Advanced RPG II Programming, June 28-30; Database Concepts, July 1-2; Computer Appreciation for Senior Executives, July 1-2; Computer System Design and Implementation, July 12-16; and Cobol Programming for the Experienced Programmer, July 19-21. More information from the Course Registrar, MSS House, 54 Chapel Road, Worthing, West Sussex BN11 1BE. Tel: Worthing (0903) 347556.

■ **ELECTRONIC Privacy** and Authentication Technology is the title of a two-day workshop to be held at Hatfield Polytechnic on July 19-20. The topics on Day One will be public key systems, authentication, protocols and related topics. On Day Two DES and other algorithms, software protection, speech systems, standardisation and related topics will be discussed.

Accommodation will be available. Details from Mrs Jill Stern, Administrative Assistant, tel: Hatfield 68100, extension 386.

Next week, I shall be writing about the implications and considerations of running and justifying sales training via both internal and external resources.

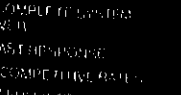

Alan Williams
